

# KSZ9031RNX

## Gigabit Ethernet Transceiver with RGMII Support

Revision 2.0

### General Description

The KSZ9031RNX is a completely integrated triple-speed (10Base-T/100Base-TX/1000Base-T) Ethernet physical-layer transceiver for transmission and reception of data on standard CAT-5 unshielded twisted pair (UTP) cable.

The KSZ9031RNX provides the reduced Gigabit media independent interface (RGMII) for direct connection to RGMII MACs in Gigabit Ethernet processors and switches for data transfer at 10/100/1000Mbps.

The KSZ9031RNX reduces board cost and simplifies board layout by using on-chip termination resistors for the four differential pairs and by integrating an LDO controller to drive a low-cost MOSFET to supply the 1.2V core.

The KSZ9031RNX offers diagnostic features to facilitate system bring-up and debugging in production testing and in product deployment. Parametric NAND tree support enables fault detection between KSZ9031 I/Os and the board. The LinkMD<sup>®</sup> TDR-based cable diagnostic identifies faulty copper cabling. Remote and local loopback functions verify analog and digital data paths.

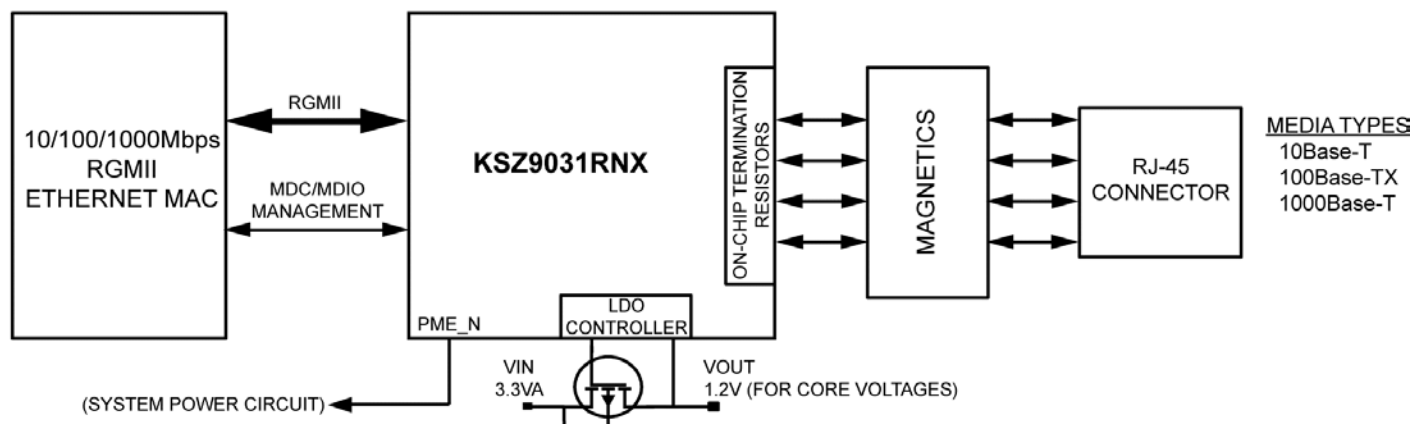

The KSZ9031RNX is available in a 48-pin, lead-free QFN package (see "Ordering Information").

Data sheets and support documentation are available on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

### Features

- Single-chip 10/100/1000Mbps IEEE 802.3-compliant Ethernet transceiver
- RGMII timing supports on-chip delay according to RGMII Version 2.0, with programming options for external delay and making adjustments and corrections to TX and RX timing paths
- RGMII with 3.3V/2.5V/1.8V tolerant I/Os
- Auto-negotiation to automatically select the highest link-up speed (10/100/1000Mbps) and duplex (half/full)
- On-chip termination resistors for the differential pairs
- On-chip LDO controller to support single 3.3V supply operation – requires only one external FET to generate 1.2V for the core
- Jumbo frame support up to 16KB
- 125MHz reference clock output
- Energy detect power-down mode for reduced power consumption when the cable is not attached
- Energy Efficient Ethernet (EEE) support with low-power idle (LPI) mode and clock stoppage for 100Base-TX/1000Base-T and transmit amplitude reduction with 10Base-T<sub>e</sub> option
- Wake-on-LAN (WOL) support with robust custom-packet detection

### Functional Diagram

Revision 2.0

## Features (Continued)

- Programmable LED outputs for link, activity, and speed
- Baseline wander correction
- LinkMD TDR-based cable diagnostic to identify faulty copper cabling
- Parametric NAND tree support to detect faults between chip I/Os and board
- Loopback modes for diagnostics
- Automatic MDI/MDI-X crossover to detect and correct pair swap at all speeds of operation
- Automatic detection and correction of pair swaps, pair skew, and pair polarity
- MDC/MDIO management interface for PHY register configuration
- Interrupt pin option
- Power-down and power-saving modes
- Operating voltages
  - Core (DVDDL, AVDDL, AVDDL\_PLL): 1.2V (external FET or regulator)
  - VDD I/O (DVDDH): 3.3V, 2.5V, or 1.8V
  - Transceiver (AVDDH): 3.3V or 2.5V (commercial temp)
- Available in a 48-pin QFN (7mm × 7mm) package

## Applications

- Laser/Network printer
- Network attached storage (NAS)
- Network server
- Gigabit LAN on motherboard (GLOM)
- Broadband gateway
- Gigabit SOHO/SMB router
- IPTV
- IP set-top box
- Game console
- Triple-play (data, voice, video) media center
- Media converter

## Ordering Information

Part Number	Temperature Range	Package	Lead Finish	Wire Bonding	Description
KSZ9031RNXCA	0°C to 70°C	48-Pin QFN	Pb-Free	Gold	RGMII, Commercial Temperature, Gold Wire Bonding
KSZ9031RNXCC <sup>(1)</sup>	0°C to 70°C	48-Pin QFN	Pb-Free	Copper	RGMII, Commercial Temperature, Copper Wire Bonding
KSZ9031RNXIA <sup>(1)</sup>	–40°C to 85°C	48-Pin QFN	Pb-Free	Gold	RGMII, Industrial Temperature, Gold Wire Bonding
KSZ9031RNXIC <sup>(1)</sup>	–40°C to 85°C	48-Pin QFN	Pb-Free	Copper	RGMII, Industrial Temperature, Copper Wire Bonding
KSZ9031RNX-EVAL	0°C to 70°C	48-Pin QFN	Pb-Free		KSZ9031RNX Evaluation Board (Mounted with KSZ9031RNX device in commercial temperature)

## Revision History

Revision	Date	Summary of Changes
1.0	10/31/12	Data sheet created
2.0	07/31/13	<ul style="list-style-type: none"><li>• Updated Functional Diagram with "PME_N" signal.</li><li>• Indicated pin type is not an open-drain for PME_N1 (Pin 17) and INT_N/PME_N2 (Pin 38).</li><li>• Deleted TSLP package height from Package Information.</li><li>• Added typical series resistance and load capacitance for crystal selection criteria.</li><li>• Added setup/hold timings for integrated delays per the RGMII v2.0 Specification.</li><li>• Added note that RGMII data-to-clock skews for 10/100Mbps speeds are looser than for 1000Mbps speed.</li><li>• Corrected register definition for override strap-in for LED_MODE in MMD Address 2h, Register 0h.</li><li>• Clarified register description for software power-down bit (Register 0h, Bit [11]).</li></ul>

Pin Configuration

## Pin Description

Pin Number	Pin Name	Type <sup>(1)</sup>	Pin Function
1	AVDDH	P	3.3V/2.5V (commercial temp only) analog V <sub>DD</sub>
2	TXRXP_A	I/O	Media Dependent Interface[0], positive signal of differential pair 1000Base-T mode: TXRXP_A corresponds to BI_DA+ for MDI configuration and BI_DB+ for MDI-X configuration, respectively. 10Base-T/100Base-TX mode: TXRXP_A is the positive transmit signal (TX+) for MDI configuration and the positive receive signal (RX+) for MDI-X configuration, respectively.
3	TXRXM_A	I/O	Media Dependent Interface[0], negative signal of differential pair 1000Base-T mode: TXRXM_A corresponds to BI_DA– for MDI configuration and BI_DB– for MDI-X configuration, respectively. 10Base-T/100Base-TX mode: TXRXM_A is the negative transmit signal (TX–) for MDI configuration and the negative receive signal (RX–) for MDI-X configuration, respectively.
4	AVDDL	P	1.2V analog V <sub>DD</sub>
5	TXRXP_B	I/O	Media Dependent Interface[1], positive signal of differential pair 1000Base-T mode: TXRXP_B corresponds to BI_DB+ for MDI configuration and BI_DA+ for MDI-X configuration, respectively. 10Base-T/100Base-TX mode: TXRXP_B is the positive receive signal (RX+) for MDI configuration and the positive transmit signal (TX+) for MDI-X configuration, respectively.
6	TXRXM_B	I/O	Media Dependent Interface[1], negative signal of differential pair 1000Base-T mode: TXRXM_B corresponds to BI_DB– for MDI configuration and BI_DA– for MDI-X configuration, respectively. 10Base-T/100Base-TX mode: TXRXM_B is the negative receive signal (RX–) for MDI configuration and the negative transmit signal (TX–) for MDI-X configuration, respectively.
7	TXRXP_C	I/O	Media Dependent Interface[2], positive signal of differential pair 1000Base-T mode: TXRXP_C corresponds to BI_DC+ for MDI configuration and BI_DD+ for MDI-X configuration, respectively. 10Base-T/100Base-TX mode: TXRXP_C is not used.
8	TXRXM_C	I/O	Media Dependent Interface[2], negative signal of differential pair 1000Base-T mode: TXRXM_C corresponds to BI_DC– for MDI configuration and BI_DD– for MDI-X configuration, respectively. 10Base-T/100Base-TX mode: TXRXM_C is not used.
9	AVDDL	P	1.2V analog V <sub>DD</sub>

**Pin Description (Continued)**

Pin Number	Pin Name	Type <sup>(1)</sup>	Pin Function																																																					
10	TXRXP_D	I/O	Media Dependent Interface[3], positive signal of differential pair 1000Base-T mode: TXRXP_D corresponds to BI_DD+ for MDI configuration and BI_DC+ for MDI-X configuration, respectively. 10Base-T/100Base-TX mode: TXRXP_D is not used.																																																					
11	TXRXM_D	I/O	Media Dependent Interface[3], negative signal of differential pair 1000Base-T mode: TXRXM_D corresponds to BI_DD– for MDI configuration and BI_DC– for MDI-X configuration, respectively. 10Base-T/100Base-TX mode: TXRXM_D is not used.																																																					
12	AVDDH	P	3.3V/2.5V (commercial temp only) analog V <sub>DD</sub>																																																					
13	NC	–	No connect This pin is not bonded and can be connected to digital ground for footprint compatibility with the Micrel KSZ9021RN Gigabit PHY.																																																					
14	DVDDL	P	1.2V digital V <sub>DD</sub>																																																					
15	LED2/ PHYAD1	I/O	LED output: Programmable LED2 output Config mode: The pull-up/pull-down value is latched as PHYAD[1] during power-up/reset. See the “Strapping Options” section for details. The LED2 pin is programmed by the LED_MODE strapping option (Pin 41), and is defined as follows: <b>Single-LED Mode</b> <table><tr><th>Link</th><th>Pin State</th><th>LED Definition</th></tr><tr><td>Link off</td><td>H</td><td>OFF</td></tr><tr><td>Link on (any speed)</td><td>L</td><td>ON</td></tr></table> <b>Tri-Color Dual-LED Mode</b> <table><tr><th rowspan="2">Link/Activity</th><th colspan="2">Pin State</th><th colspan="2">LED Definition</th></tr><tr><th>LED2</th><th>LED1</th><th>LED2</th><th>LED1</th></tr><tr><td>Link off</td><td>H</td><td>H</td><td>OFF</td><td>OFF</td></tr><tr><td>1000 Link / No activity</td><td>L</td><td>H</td><td>ON</td><td>OFF</td></tr><tr><td>1000 Link / Activity (RX, TX)</td><td>Toggle</td><td>H</td><td>Blinking</td><td>OFF</td></tr><tr><td>100 Link / No activity</td><td>H</td><td>L</td><td>OFF</td><td>ON</td></tr><tr><td>100 Link / Activity (RX, TX)</td><td>H</td><td>Toggle</td><td>OFF</td><td>Blinking</td></tr><tr><td>10 Link / No activity</td><td>L</td><td>L</td><td>ON</td><td>ON</td></tr><tr><td>10 Link / Activity (RX, TX)</td><td>Toggle</td><td>Toggle</td><td>Blinking</td><td>Blinking</td></tr></table> For tri-color dual-LED mode, LED2 works in conjunction with LED1 (Pin 17) to indicate 10Mbps link and activity.	Link	Pin State	LED Definition	Link off	H	OFF	Link on (any speed)	L	ON	Link/Activity	Pin State		LED Definition		LED2	LED1	LED2	LED1	Link off	H	H	OFF	OFF	1000 Link / No activity	L	H	ON	OFF	1000 Link / Activity (RX, TX)	Toggle	H	Blinking	OFF	100 Link / No activity	H	L	OFF	ON	100 Link / Activity (RX, TX)	H	Toggle	OFF	Blinking	10 Link / No activity	L	L	ON	ON	10 Link / Activity (RX, TX)	Toggle	Toggle	Blinking	Blinking
Link	Pin State	LED Definition																																																						
Link off	H	OFF																																																						
Link on (any speed)	L	ON																																																						
Link/Activity	Pin State		LED Definition																																																					
	LED2	LED1	LED2	LED1

10 Link / Activity (RX, TX)	Toggle	Toggle	Blinking	Blinking																																																				
16	DVDDH	P	3.3V, 2.5V, or 1.8V digital V <sub>DD,I/O</sub>																																																					

## Pin Description (Continued)

Pin Number	Pin Name	Type <sup>(1)</sup>	Pin Function																																									
17	LED1/ PHYAD0/  PME_N1	I/O	LED1 output: Programmable LED1 output																																									
			Config mode: The voltage on this pin is sampled and latched during the power-up/reset process to determine the value of PHYAD[0]. See the “ <a href="#">Strapping Options</a> ” section for details.																																									
			PME_N output: Programmable PME_N output (pin option 1). This pin function requires an external pull-up resistor to DVDDH (digital V <sub>DD,I/O</sub> ) in a range from 1.0kΩ to 4.7kΩ. When asserted low, this pin signals that a WOL event has occurred.																																									
			This pin is not an open-drain for all operating modes.																																									
			The LED1 pin is programmed by the LED_MODE strapping option (Pin 41), and is defined as follows.																																									
			<b>Single-LED Mode</b>																																									
			<table><tr><th>Activity</th><th>Pin State</th><th>LED Definition</th></tr><tr><td>No activity</td><td>H</td><td>OFF</td></tr><tr><td>Activity (RX, TX)</td><td>Toggle</td><td>Blinking</td></tr></table>	Activity	Pin State	LED Definition	No activity	H	OFF	Activity (RX, TX)	Toggle	Blinking

25	TX_EN	I	RGMII mode: RGMII TX_CTL (Transmit Control) input																																									
26	DVDDL	P	1.2V digital V <sub>DD</sub>																																									
27	RXD3/ MODE3	I/O	RGMII mode: RGMII RD3 (Receive Data 3) output Config mode: The pull-up/pull-down value is latched as MODE3 during power-up/reset. See the “ <a href="#">Strapping Options</a> ” section for details.																																									
28	RXD2/ MODE2	I/O	RGMII mode: RGMII RD2 (Receive Data 2) output Config mode: The pull-up/pull-down value is latched as MODE2 during power-up/reset. See the “ <a href="#">Strapping Options</a> ” section for details.																																									

**Pin Description (Continued)**

Pin Number	Pin Name	Type <sup>(1)</sup>	Pin Function
29	VSS	Gnd	Digital ground
30	DVDDL	P	1.2V digital V <sub>DD</sub>
31	RXD1/ MODE1	I/O	RGMII mode: RGMII RD1 (Receive Data 1) output Config mode: The pull-up/pull-down value is latched as MODE1 during power-up/reset. See the “ <a href="#">Strapping Options</a> ” section for details.
32	RXD0/ MODE0	I/O	RGMII mode: RGMII RD0 (Receive Data 0) output Config mode: The pull-up/pull-down value is latched as MODE0 during power-up/reset. See the “ <a href="#">Strapping Options</a> ” section for details.
33	RX_DV/ CLK125_EN	I/O	RGMII mode: RGMII RX_CTL (Receive Control) output Config mode: Latched as CLK125_NDO Output Enable during power-up/reset. See the “ <a href="#">Strapping Options</a> ” section for details.
34	DVDDH	P	3.3V, 2.5V, or 1.8V digital V <sub>DD_I/O</sub>
35	RX_CLK/ PHYAD2	I/O	RGMII mode: RGMII RXC (Receive Reference Clock) output Config mode: The pull-up/pull-down value is latched as PHYAD[2] during power-up/reset. See the “ <a href="#">Strapping Options</a> ” section for details.
36	MDC	Ipu	Management data clock input This pin is the input reference clock for MDIO (Pin 37).
37	MDIO	Ipu/O	Management data input/output This pin is synchronous to MDC (Pin 36) and requires an external pull-up resistor to DVDDH (digital V <sub>DD_I/O</sub> ) in a range from 1.0kΩ to 4.7kΩ.
38	INT_N/  PME_N2	O	Interrupt output: Programmable interrupt output, with Register 1Bh as the Interrupt Control/Status register, for programming the interrupt conditions and reading the interrupt status. Register 1Fh, Bit [14] sets the interrupt output to active low (default) or active high. PME_N output: Programmable PME_N output (pin option 2). When asserted low, this pin signals that a WOL event has occurred. For Interrupt (when active low) and PME functions, this pin requires an external pull-up resistor to DVDDH (digital V <sub>DD_I/O</sub> ) in a range from 1.0kΩ to 4.7kΩ. This pin is not an open-drain for all operating modes.
39	DVDDL	P	1.2V digital V <sub>DD</sub>
40	DVDDH	P	3.3V, 2.5V, or 1.8V digital V <sub>DD_I/O</sub>
41	CLK125_NDO/ LED_MODE	I/O	125MHz clock output This pin provides a 125MHz reference clock output option for use by the MAC. Config mode: The pull-up/pull-down value is latched as LED_MODE during power-up/reset. See the “ <a href="#">Strapping Options</a> ” section for details.
42	RESET_N	Ipu	Chip reset (active low) Hardware pin configurations are strapped-in at the de-assertion (rising edge) of RESET_N. See the “ <a href="#">Strapping Options</a> ” section for more details.
43	LDO_O	O	On-chip 1.2V LDO controller output This pin drives the input gate of a P-channel MOSFET to generate 1.2V for the chip's core voltages. If the system provides 1.2V and this pin is not used, it can be left floating.
44	AVDDL_PLL	P	1.2V analog V <sub>DD</sub> for PLL
45	XO	O	25MHz crystal feedback This pin is a no connect if an oscillator or external clock source is used.

**Pin Description (Continued)**

Pin Number	Pin Name	Type <sup>(1)</sup>	Pin Function
46	XI	I	Crystal / Oscillator/ External Clock input 25MHz $\pm$ 50ppm tolerance
47	NC	–	No connect This pin is not bonded and can be connected to AVDDH power for footprint compatibility with the Micrel KSZ9021RN Gigabit PHY.
48	ISET	I/O	Set the transmit output level Connect a 12.1k $\Omega$ 1% resistor to ground on this pin.
PADDLE	P_GND	Gnd	Exposed paddle on bottom of chip Connect P_GND to ground.

**Note:**

1. P = Power supply.  
Gnd = Ground.  
I = Input.  
O = Output.  
I/O = Bi-directional.  
Ipu = Input with internal pull-up (see [“Electrical Characteristics”](#) for value).  
Ipu/O = Input with internal pull-up (see [“Electrical Characteristics”](#) for value)/Output.

1011	Reserved – not used																																						
1100	RGMII mode – advertise 1000Base-T full-duplex only																																						
1101	RGMII mode – advertise 1000Base-T full- and half-duplex only																																						
1110	RGMII mode – advertise all capabilities (10/100/1000 speed half-/full-duplex), except 1000Base-T half-duplex																																						
1111	RGMII mode – advertise all capabilities (10/100/1000 speed half-/full-duplex)																																						
33	CLK125_EN	I/O	CLK125_EN is sampled and latched at power-up/reset and is defined as follows:  Pull-up = Enable 125MHz clock output Pull-down = Disable 125MHz clock output  Pin 41 (CLK125_NDO) provides the 125MHz reference clock output option for use by the MAC.																																				
41	LED_MODE	I/O	LED_MODE is latched at power-up/reset and is defined as follows:  Pull-up = Single-LED mode Pull-down = Tri-color dual-LED mode																																				

**Note:**

1. I/O = Bi-directional.

Pin strap-ins are latched during power-up or reset. In some systems, the MAC receive input pins may be driven during power-up or reset, and consequently cause the PHY strap-in pins on the RGMII signals to be latched to an incorrect configuration. In this case, Micrel recommends adding external pull-ups/pull-downs on the PHY strap-in pins to ensure the PHY is configured to the correct pin strap-in mode.

## Functional Overview

The KSZ9031RNX is a completely integrated triple-speed (10Base-T/100Base-TX/1000Base-T) Ethernet physical layer transceiver solution for transmission and reception of data over a standard CAT-5 unshielded twisted pair (UTP) cable. Its on-chip proprietary 1000Base-T transceiver and Manchester/MLT-3 signaling-based 10Base-T/100Base-TX transceivers are all IEEE 802.3 compliant.

The KSZ9031RNX reduces board cost and simplifies board layout by using on-chip termination resistors for the four differential pairs and by integrating an LDO controller to drive a low-cost MOSFET to supply the 1.2V core.

On the copper media interface, the KSZ9031RNX can automatically detect and correct for differential pair misplacements and polarity reversals, and correct propagation delays and re-sync timing between the four differential pairs, as specified in the IEEE 802.3 standard for 1000Base-T operation.

The KSZ9031RNX provides the RGMII interface for direct and seamless connection to RGMII MACs in Gigabit Ethernet processors and switches for data transfer at 10/100/1000Mbps.

Figure 1 shows a high-level block diagram of the KSZ9031RNX.

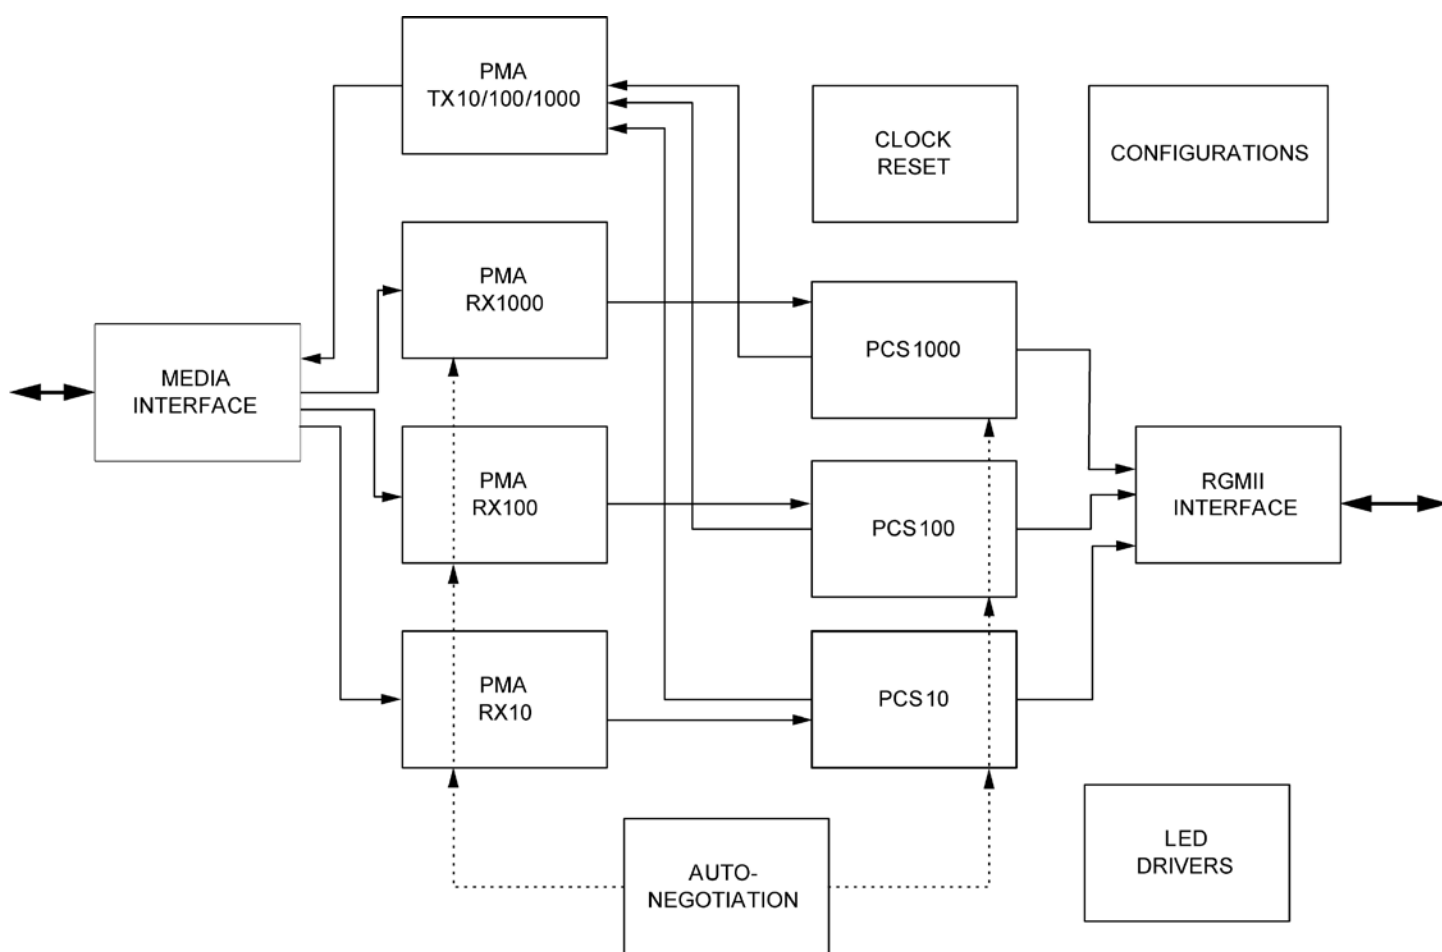

Figure 1. KSZ9031RNX Block Diagram

## Functional Description: 10Base-T/100Base-TX Transceiver

### 100Base-TX Transmit

The 100Base-TX transmit function performs parallel-to-serial conversion, 4B/5B coding, scrambling, NRZ-to-NRZI conversion, and MLT-3 encoding and transmission.

The circuitry starts with a parallel-to-serial conversion, which converts the RGMII data from the MAC into a 125MHz serial bit stream. The data and control stream is then converted into 4B/5B coding, followed by a scrambler. The serialized data is further converted from NRZ-to-NRZI format then transmitted in MLT-3 current output. The output current is set by an external 12.1k $\Omega$  1% resistor for the 1:1 transformer ratio.

The output signal has a typical rise/fall time of 4ns and complies with the ANSI TP-PMD standard regarding amplitude balance, overshoot, and timing jitter. The wave-shaped 10Base-T output is also incorporated into the 100Base-TX transmitter.

### 100Base-TX Receive

The 100BASE-TX receiver function performs adaptive equalization, DC restoration, MLT-3-to-NRZI conversion, data and clock recovery, NRZI-to-NRZ conversion, de-scrambling, 4B/5B decoding, and serial-to-parallel conversion.

The receiving side starts with the equalization filter to compensate for inter-symbol interference (ISI) over the twisted pair cable. Because the amplitude loss and phase distortion are a function of the cable length, the equalizer must adjust its characteristics to optimize performance. In this design, the variable equalizer makes an initial estimation based on comparisons of incoming signal strength against some known cable characteristics, then tunes itself for optimization. This is an ongoing process and self-adjusts against environmental changes such as temperature variations.

Next, the equalized signal goes through a DC-restoration and data-conversion block. The DC-restoration circuit compensates for the effect of baseline wander and improves the dynamic range. The differential data-conversion circuit converts the MLT-3 format back to NRZI. The slicing threshold is also adaptive.

The clock-recovery circuit extracts the 125MHz clock from the edges of the NRZI signal. This recovered clock is then used to convert the NRZI signal into the NRZ format. This signal is sent through the de-scrambler followed by the 4B/5B decoder. Finally, the NRZ serial data is converted to the RGMII format and provided as the input data to the MAC.

### Scrambler/De-Scrambler (100Base-TX only)

The purpose of the scrambler is to spread the power spectrum of the signal to reduce electromagnetic interference (EMI) and baseline wander. Transmitted data is scrambled using an 11-bit wide linear feedback shift register (LFSR). The scrambler generates a 2047-bit non-repetitive sequence, then the receiver de-scrambles the incoming data stream using the same sequence as at the transmitter.

### 10Base-T Transmit

The 10Base-T output drivers are incorporated into the 100Base-TX drivers to allow for transmission with the same magnetic. The drivers perform internal wave-shaping and pre-emphasis, and output signals with a typical amplitude of 2.5V peak for standard 10Base-T mode and 1.75V peak for energy-efficient 10Base-Te mode. The 10Base-T/10Base-Te signals have harmonic contents that are at least 31dB below the fundamental frequency when driven by an all-ones Manchester-encoded signal.

### 10Base-T Receive

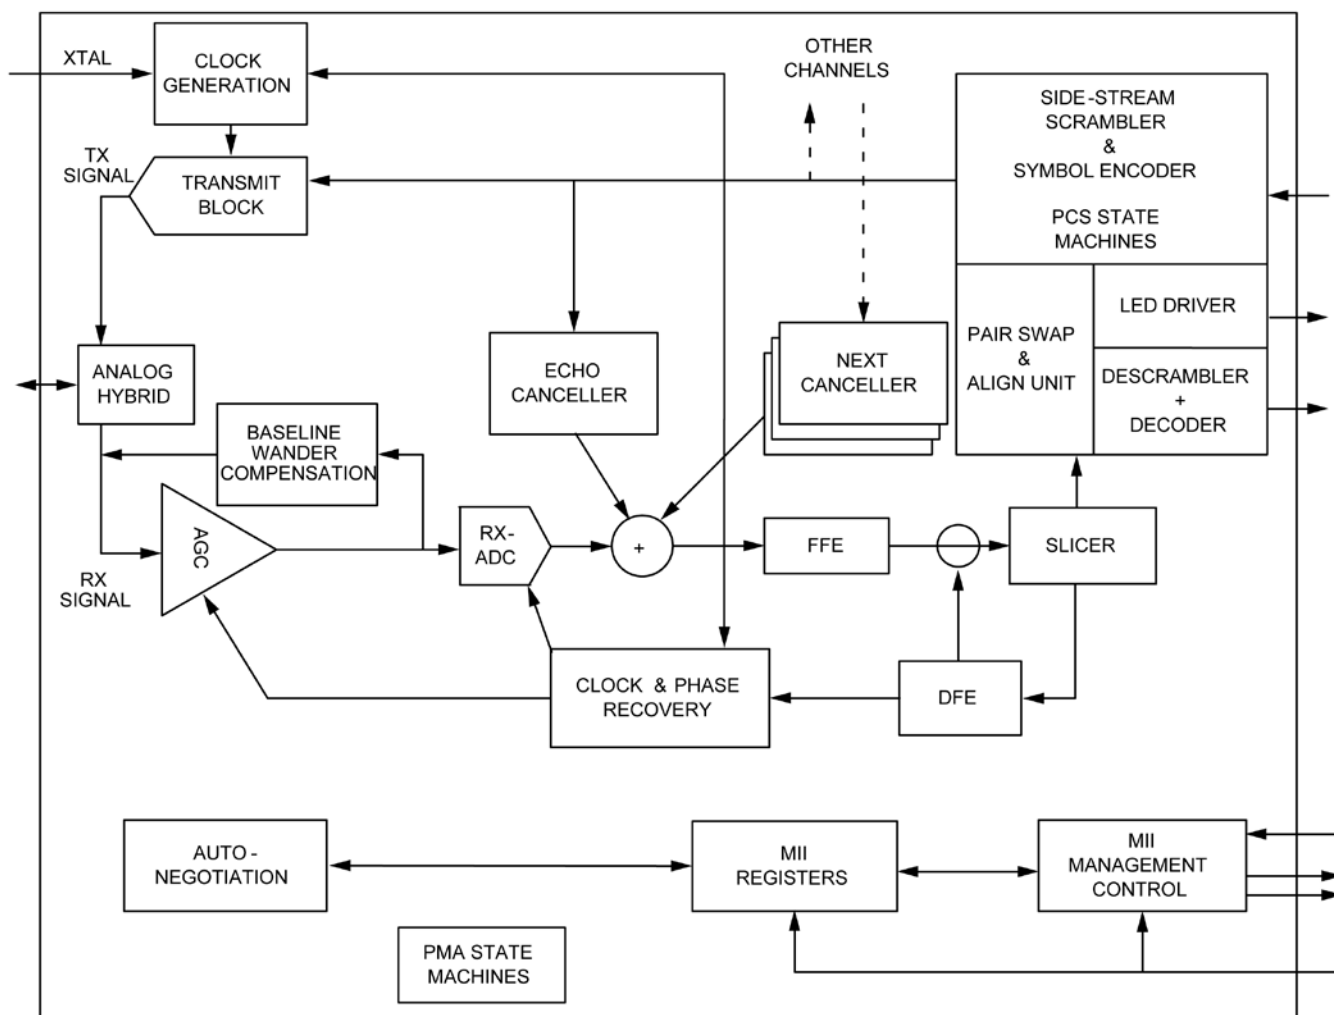

On the receive side, input buffer and level-detecting squelch circuits are used. A differential input receiver circuit and a phase-locked loop (PLL) perform the decoding function. The Manchester-encoded data stream is separated into clock signal and NRZ data. A squelch circuit rejects signals with levels less than 300mV or with short pulse widths to prevent noises at the receive inputs from falsely triggering the decoder. When the input exceeds the squelch limit, the PLL locks onto the incoming signal and the KSZ9031RNX decodes a data frame. The receiver clock is maintained active during idle periods between receiving data frames.

Auto-polarity correction is provided for the receive differential pair to automatically swap and fix the incorrect +/- polarity wiring in the cabling.

## Functional Description: 1000Base-T Transceiver

The 1000Base-T transceiver is based-on a mixed-signal/digital-signal processing (DSP) architecture, which includes the analog front-end, digital channel equalizers, trellis encoders/decoders, echo cancellers, cross-talk cancellers, precision clock recovery scheme, and power-efficient line drivers.

Figure 2 shows a high-level block diagram of a single channel of the 1000Base-T transceiver for one of the four differential pairs.

**Figure 2. KSZ9031RX 1000Base-T Transceiver Block Diagram – Single Channel**

## Analog Echo-Cancellation Circuit

In 1000Base-T mode, the analog echo-cancellation circuit helps to reduce the near-end echo. This analog hybrid circuit relieves the burden of the ADC and the adaptive equalizer.

This circuit is disabled in 10Base-T/100Base-TX mode.

## Automatic Gain Control (AGC)

In 1000Base-T mode, the automatic gain control (AGC) circuit provides initial gain adjustment to boost up the signal level. This pre-conditioning circuit is used to improve the signal-to-noise ratio of the receive signal.

## Analog-to-Digital Converter (ADC)

In 1000Base-T mode, the analog-to-digital converter (ADC) digitizes the incoming signal. ADC performance is essential to the overall performance of the transceiver.

This circuit is disabled in 10Base-T/100Base-TX mode.

## Timing Recovery Circuit

In 1000Base-T mode, the mixed-signal clock recovery circuit together with the digital phase-locked loop is used to recover and track the incoming timing information from the received data. The digital phase-locked loop has very low long-term jitter to maximize the signal-to-noise ratio of the receive signal.

The 1000Base-T slave PHY must transmit the exact receive clock frequency recovered from the received data back to the 1000Base-T master PHY. Otherwise, the master and slave will not be synchronized after long transmission. This also helps to facilitate echo cancellation and NEXT removal.

## Adaptive Equalizer

In 1000Base-T mode, the adaptive equalizer provides the following functions:

- Detection for partial response signaling
- Removal of NEXT and ECHO noise
- Channel equalization

Signal quality is degraded by residual echo that is not removed by the analog hybrid because of impedance mismatch. The KSZ9031RNX uses a digital echo canceller to further reduce echo components on the receive signal.

In 1000Base-T mode, data transmission and reception occurs simultaneously on all four pairs of wires (four channels). This results in high-frequency cross-talk coming from adjacent wires. The KSZ9031RNX uses three NEXT cancellers on each receive channel to minimize the cross-talk induced by the other three channels.

In 10Base-T/100Base-TX mode, the adaptive equalizer needs only to remove the inter-symbol interference and recover the channel loss from the incoming data.

## Trellis Encoder and Decoder

In 1000Base-T mode, the transmitted 8-bit data is scrambled into 9-bit symbols and further encoded into 4D-PAM5 symbols. The initial scrambler seed is determined by the specific PHY address to reduce EMI when more than one KSZ9031RNX is used on the same board. On the receiving side, the idle stream is examined first. The scrambler seed, pair skew, pair order, and polarity must be resolved through the logic. The incoming 4D-PAM5 data is then converted into 9-bit symbols and de-scrambled into 8-bit data.

## Functional Description: 10/100/1000 Transceiver Features

### Auto MDI/MDI-X

The Automatic MDI/MDI-X feature eliminates the need to determine whether to use a straight cable or a crossover cable between the KSZ9031RNX and its link partner. This auto-sense function detects the MDI/MDI-X pair mapping from the link partner, and assigns the MDI/MDI-X pair mapping of the KSZ9031RNX accordingly.

Table 1 shows the KSZ9031RNX 10/100/1000 pin configuration assignments for MDI/MDI-X pin mapping.

Pin (RJ-45 pair)	MDI			MDI-X		
	1000Base-T	100Base-TX	10Base-T	1000Base-T	100Base-TX	10Base-T
TXRXP/M_A (1,2)	A+/-	TX+/-	TX+/-	B+/-	RX+/-	RX+/-
TXRXP/M_B (3,6)	B+/-	RX+/-	RX+/-	A+/-	TX+/-	TX+/-
TXRXP/M_C (4,5)	C+/-	Not used	Not used	D+/-	Not used	Not used
TXRXP/M_D (7,8)	D+/-	Not used	Not used	C+/-	Not used	Not used

Table 1. MDI/MDI-X Pin Mapping

Auto MDI/MDI-X is enabled by default. It is disabled by writing a one to Register 1Ch, Bit [6]. MDI and MDI-X mode is set by Register 1Ch, Bit [7] if Auto MDI/MDI-X is disabled.

An isolation transformer with symmetrical transmit and receive data paths is recommended to support Auto MDI/MDI-X.

### Pair-Swap, Alignment, and Polarity Check

In 1000Base-T mode, the KSZ9031RNX

- Detects incorrect channel order and automatically restores the pair order for the A, B, C, D pairs (four channels)
- Supports  $50\pm 10$ ns difference in propagation delay between pairs of channels in accordance with the IEEE 802.3 standard, and automatically corrects the data skew so the corrected four pairs of data symbols are synchronized

Incorrect pair polarities of the differential signals are automatically corrected for all speeds.

### Wave Shaping, Slew-Rate Control, and Partial Response

In communication systems, signal transmission encoding methods are used to provide the noise-shaping feature and to minimize distortion and error in the transmission channel.

- For 1000Base-T, a special partial-response signaling method is used to provide the band-limiting feature for the transmission path.
- For 100Base-TX, a simple slew-rate control method is used to minimize EMI.
- For 10Base-T, pre-emphasis is used to extend the signal quality through the cable.

### PLL Clock Synthesizer

The KSZ9031RNX generates 125MHz, 25MHz, and 10MHz clocks for system timing. Internal clocks are generated from the external 25MHz crystal or reference clock.

### Auto-Negotiation

The KSZ9031RNX conforms to the auto-negotiation protocol, defined in Clause 28 of the IEEE 802.3 Specification.

Auto-negotiation allows UTP (unshielded twisted pair) link partners to select the highest common mode of operation.

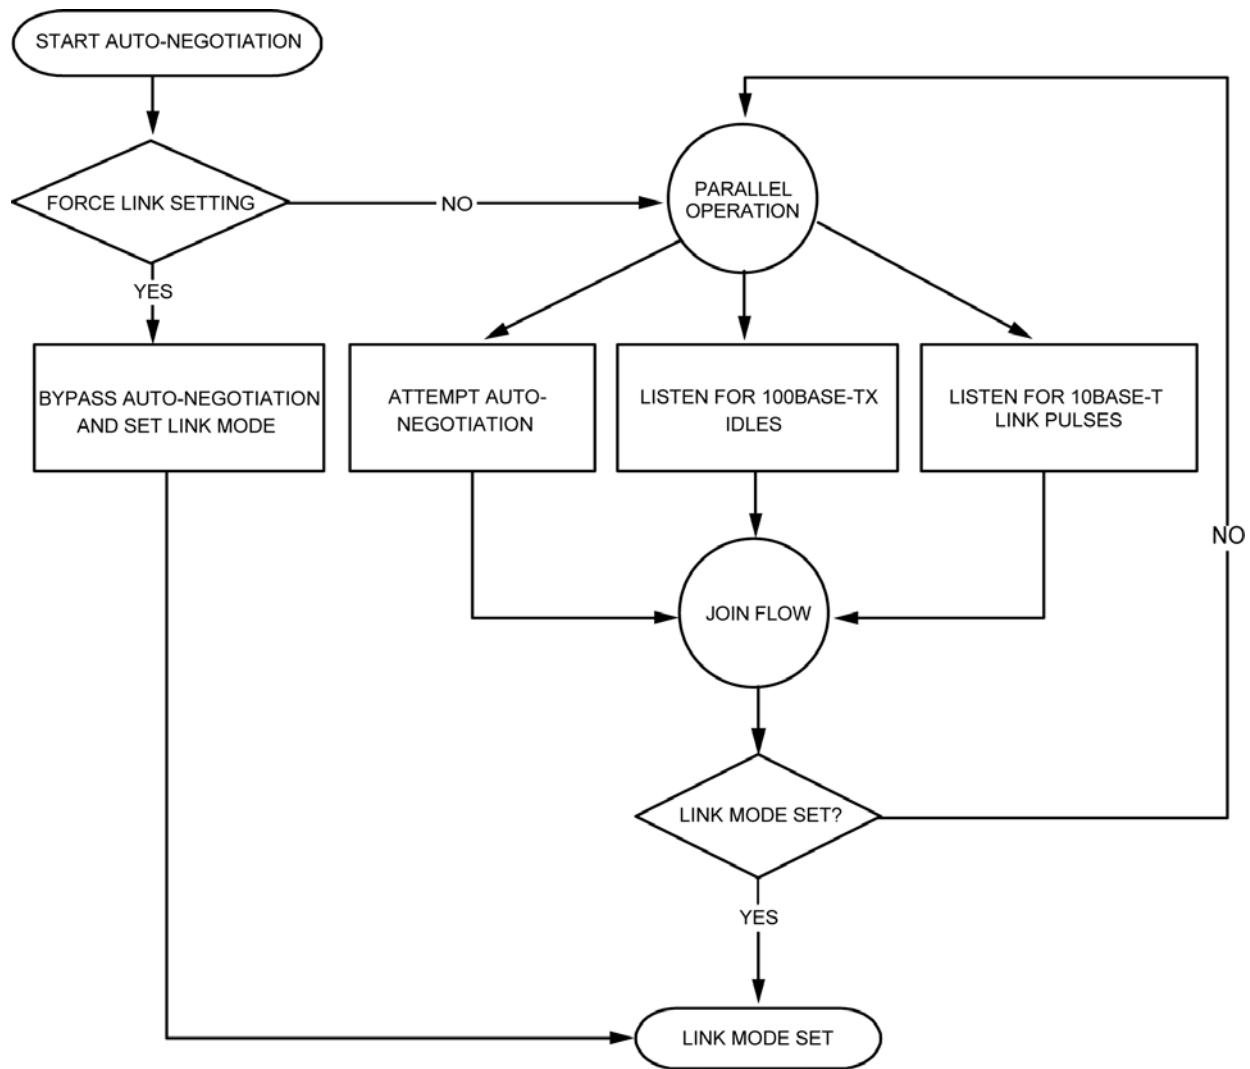

During auto-negotiation, link partners advertise capabilities across the UTP link to each other, and then compare their own capabilities with those they received from their link partners. The highest speed and duplex setting that is common to the two link partners is selected as the operating mode.

The following list shows the speed and duplex operation mode from highest to lowest.

- Priority 1: 1000Base-T, full-duplex
- Priority 2: 1000Base-T, half-duplex
- Priority 3: 100Base-TX, full-duplex
- Priority 4: 100Base-TX, half-duplex
- Priority 5: 10Base-T, full-duplex
- Priority 6: 10Base-T, half-duplex

If auto-negotiation is not supported or the KSZ9031RNX link partner is forced to bypass auto-negotiation for 10Base-T and 100Base-TX modes, the KSZ9031RNX sets its operating mode by observing the input signal at its receiver. This is known as parallel detection, and allows the KSZ9031RNX to establish a link by listening for a fixed signal protocol in the absence of the auto-negotiation advertisement protocol.

The auto-negotiation link-up process is shown in [Figure 3](#).

**Figure 3. Auto-Negotiation Flow Chart**

For 1000Base-T mode, auto-negotiation is always required to establish a link. During 1000Base-T auto-negotiation, the master and slave configuration is first resolved between link partners. Then the link is established with the highest common capabilities between link partners.

Auto-negotiation is enabled by default after power-up or hardware reset. After that, auto-negotiation can be enabled or disabled through Register 0h, Bit [12]. If auto-negotiation is disabled, the speed is set by Register 0h, Bits [6, 13] and the duplex is set by Register 0h, Bit [8].

If the speed is changed on the fly, the link goes down and auto-negotiation and parallel detection initiate until a common speed between KSZ9031RNX and its link partner is re-established for a link.

If the link is already established and there is no change of speed on the fly, the changes (for example, duplex and pause capabilities) will not take effect unless either auto-negotiation is restarted through Register 0h, Bit [9], or a link-down to link-up transition occurs (that is, disconnecting and reconnecting the cable).

After auto-negotiation is completed, the link status is updated in Register 1h, Bit [2], and the link partner capabilities are updated in Registers 5h, 6h, 8h, and Ah.

The auto-negotiation finite state machines use interval timers to manage the auto-negotiation process. The duration of these timers under normal operating conditions is summarized in [Table 2](#).

Auto-Negotiation Interval Timers	Time Duration
Transmit burst interval	16 ms
Transmit pulse interval	68 $\mu$ s
FLP detect minimum time	17.2 $\mu$ s
FLP detect maximum time	185 $\mu$ s
Receive minimum burst interval	6.8 ms
Receive maximum burst interval	112 ms
Data detect minimum interval	35.4 $\mu$ s
Data detect maximum interval	95 $\mu$ s
NLP test minimum interval	4.5 ms
NLP test maximum interval	30 ms
Link loss time	52 ms
Break link time	1480 ms
Parallel detection wait time	830 ms
Link enable wait time	1000 ms

Table 2. Auto-Negotiation Timers

## RGMII Interface

The Reduced Gigabit Media Independent Interface (RGMII) supports on-chip data-to-clock delay timing according to the RGMII Version 2.0 Specification, with programming options for external delay timing and to adjust and correct TX and RX timing paths.

RGMII provides a common interface between RGMII PHYs and MACs, and has the following key characteristics:

- Pin count is reduced from 24 pins for the IEEE Gigabit Media Independent Interface (GMII) to 12 pins for RGMII.
- All speeds (10Mbps, 100Mbps, and 1000Mbps) are supported at both half- and full-duplex.
- Data transmission and reception are independent and belong to separate signal groups.
- Transmit data and receive data are each four bits wide, a nibble.

In RGMII operation, the RGMII pins function as follows:

- The MAC sources the transmit reference clock, TXC, at 125MHz for 1000Mbps, 25MHz for 100Mbps, and 2.5MHz for 10Mbps.
- The PHY recovers and sources the receive reference clock, RXC, at 125MHz for 1000Mbps, 25MHz for 100Mbps, and 2.5MHz for 10Mbps..
- For 1000Base-T, the transmit data, TXD[3:0], is presented on both edges of TXC, and the received data, RXD[3:0], is clocked out on both edges of the recovered 125MHz clock, RXC.
- For 10Base-T/100Base-TX, the MAC holds TX\_CTL low until both PHY and MAC operate at the same speed. During the speed transition, the receive clock is stretched on either a positive or negative pulse to ensure that no clock glitch is presented to the MAC.
- TX\_ER and RX\_ER are combined with TX\_EN and RX\_DV, respectively, to form TX\_CTL and RX\_CTL. These two RGMII control signals are valid at the falling clock edge.

After power-up or reset, the KSZ9031RNX is configured to RGMII mode if the MODE[3:0] strap-in pins are set to one of the RGMII mode capability options. See the “[Strapping Options](#)” section for available options.

The KSZ9031RNX has the option to output a 125MHz reference clock on the CLK125\_NDO pin. This clock provides a lower-cost reference clock alternative for RGMII MACs that require a 125MHz crystal or oscillator. The 125MHz clock output is enabled after power-up or reset if the CLK125\_EN strap-in pin is pulled high.

## RGMII Signal Definition

Table 3 describes the RGMII signals. Refer to the RGMII Version 2.0 Specification for more detailed information.

RGMII Signal Name (per spec)	RGMII Signal Name (per KSZ9031RNX)	Pin Type (with respect to PHY)	Pin Type (with respect to MAC)	Description
TXC	GTX_CLK	Input	Output	Transmit Reference Clock (125MHz for 1000Mbps, 25MHz for 100Mbps, 2.5MHz for 10Mbps)
TX_CTL	TX_EN	Input	Output	Transmit Control
TXD[3:0]	TXD[3:0]	Input	Output	Transmit Data[3:0]
RXC	RX_CLK	Output	Input	Receive Reference Clock (125MHz for 1000Mbps, 25MHz for 100Mbps, 2.5MHz for 10Mbps)
RX_CTL	RX_DV	Output	Input	Receive Control
RXD[3:0]	RXD[3:0]	Output	Input	Receive Data[3:0]

Table 3. RGMII Signal Definition

## RGMII Signal Diagram

The KSZ9031RNX RGMII pin connections to the MAC are shown in Figure 4.

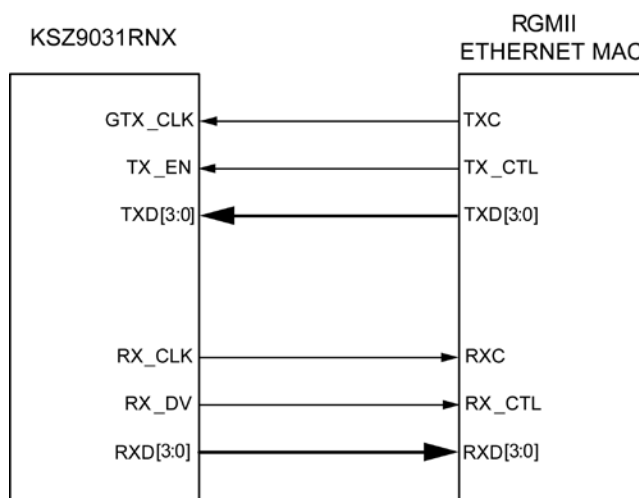

Figure 4. KSZ9031RNX RGMII Interface

## RGMII Pad Skew Registers

Pad skew registers are available for all RGMII pins (clocks, control signals, and data bits) to provide programming options to adjust or correct the timing relationship for each RGMII pin. Because RGMII is a source-synchronous bus interface, the timing relationship needs to be maintained only within the RGMII pin's respective timing group.

- RGMII transmit timing group pins: GTX\_CLK, TX\_EN, TXD[3:0]
- RGMII receive timing group pins: RX\_CLK, RX\_DV, RXD[3:0]

The following four registers located at MMD Address 2h are provided for pad skew programming.

Address	Name	Description	Mode	Default
<b>MMD Address 2h, Register 4h – RGMII Control Signal Pad Skew</b>				
2.4.15:8	Reserved	Reserved	RW	0000_0000
2.4.7:4	RX_DV Pad Skew	RGMII RX_CTL output pad skew control (0.06ns/step)	RW	0111
2.4.3:0	TX_EN Pad Skew	RGMII TX_CTL input pad skew control (0.06ns/step)	RW	0111
<b>MMD Address 2h, Register 5h – RGMII RX Data Pad Skew</b>				
2.5.15:12	RXD3 Pad Skew	RGMII RXD3 output pad skew control (0.06ns/step)	RW	0111
2.5.11:8	RXD2 Pad Skew	RGMII RXD2 output pad skew control (0.06ns/step)	RW	0111
2.5.7:4	RXD1 Pad Skew	RGMII RXD1 output pad skew control (0.06ns/step)	RW	0111
2.5.3:0	RXD0 Pad Skew	RGMII RXD0 output pad skew control (0.06ns/step)	RW	0111
<b>MMD Address 2h, Register 6h – RGMII TX Data Pad Skew</b>				
2.6.15:12	TXD3 Pad Skew	RGMII TXD3 output pad skew control (0.06ns/step)	RW	0111
2.6.11:8	TXD2 Pad Skew	RGMII TXD2 output pad skew control (0.06ns/step)	RW	0111
2.6.7:4	TXD1 Pad Skew	RGMII TXD1 output pad skew control (0.06ns/step)	RW	0111
2.6.3:0	TXD0 Pad Skew	RGMII TXD0 output pad skew control (0.06ns/step)	RW	0111
<b>MMD Address 2h, Register 8h – RGMII Clock Pad Skew</b>				
2.8.15:10	Reserved	Reserved	RW	0000_00
2.8.9:5	GTX_CLK Pad Skew	RGMII GTX_CLK input pad skew control (0.06ns/step)	RW	01_111
2.8.4:0	RX_CLK Pad Skew	RGMII RX_CLK output pad skew control (0.06ns/step)	RW	0_1111

**Table 4. RGMII Pad Skew Registers**

The RGMII control signals and data bits have 4-bit skew settings, while the RGMII clocks have 5-bit skew settings. Each register bit is approximately a 0.06ns step change. A single-bit decrement decreases the delay by approximately 0.06ns, while a single-bit increment increases the delay by approximately 0.06ns.

Table 5 and Table 6 list the approximate absolute delay for each pad skew (value) setting.

Pad Skew (value)	Delay (ns)
0_0000	−0.90
0_0001	−0.84
0_0010	−0.78
0_0011	−0.72
0_0100	−0.66
0_0101	−0.60
0_0110	−0.54
0_0111	−0.48
0_1000	−0.42
0_1001	−0.36
0_1010	−0.30
0_1011	−0.24
0_1100	−0.18
0_1101	−0.12
0_1110	−0.06
0_1111	No delay adjustment (default value)
1_0000	+0.06
1_0001	+0.12
1_0010	+0.18
1_0011	+0.24
1_0100	+0.30
1_0101	+0.36
1_0110	+0.42
1_0111	+0.48
1_1000	+0.54
1_1001	+0.60
1_1010	+0.66
1_1011	+0.72
1_1100	+0.78
1_1101	+0.84
1_1110	+0.90
1_1111	+0.96

**Table 5. Absolute Delay for 5-Bit Pad Skew Setting**

Pad Skew (value)	Delay (ns)
0000	-0.42
0001	-0.36
0010	-0.30

**Table 6. Absolute Delay for 4-Bit Pad Skew Setting**

When computing the RGMII timing relationships, delays along the entire data path must be aggregated to determine the total delay to be used for comparison between RGMII pins within their respective timing group. For the transmit data path, total delay includes MAC output delay, MAC-to-PHY PCB routing delay, and PHY (KSZ9031RNX) input delay and skew setting (if any). For the receive data path, the total delay includes PHY (KSZ9031RNX) output delay, PHY-to-MAC PCB routing delay, and MAC input delay and skew setting (if any).

After power-up or reset, the KSZ9031RNX defaults to the following timings at its RGMII I/O pins to support on-chip data-to-clock skew timing according to the RGMII Version 2.0 Specification:

- Transmit Inputs: GTX\_CLK clock is in sync within  $\pm 500\text{ps}$  of TX\_EN and TXD[3:0]
- Receive outputs: RX\_CLK is delayed about 1.2ns with respect to RX\_DV and RXD[3:0]

The above default RGMII timings imply:

- RX\_CLK clock skew is set by the KSZ9031RNX default register settings.
- GTX\_CLK clock skew is provided by the MAC.
- No PCB delay is required for GTX\_CLK and RX\_CLK clocks.

The following examples show how to read/write to MMD Address 2h, Register 8h for the RGMII GTX\_CLK and RX\_CLK skew settings. MMD register access is through the direct portal Registers Dh and Eh. For more programming details, refer to the “[MMD Registers – Descriptions](#)” section.

- Read back value of MMD Address 2h, Register 8h.
  - Write Register 0xD = 0x0002 // Select MMD Device Address 2h
  - Write Register 0xE = 0x0008 // Select Register 8h of MMD Device Address 2h
  - Write Register 0xD = 0x4002 // Select register data for MMD Device Address 2h, Register 8h
  - Read Register 0xE // Read value of MMD Device Address 2h, Register 8h

- Write value 0x03FF (delay GTX\_CLK and RX\_CLK pad skews to their maximum values) to MMD Address 2h, Register 8h
  - Write Register 0xD = 0x0002 // Select MMD Device Address 2h
  - Write Register 0xE = 0x0008 // Select Register 8h of MMD Device Address 2h
  - Write Register 0xD = 0x4002 // Select register data for MMD Device Address 2h, Register 8h
  - Write Register 0xE = 0x03FF // Write value 0x03FF to MMD Device Address 2h, Register 8h

### RGMI In-Band Status

The KSZ9031RNX provides in-band status to the MAC during the inter-frame gap when RX\_DV is de-asserted. RGMII in-band status is always enabled after power-up.

The in-band status is sent to the MAC using the RXD[3:0] data pins, and is described in [Table 7](#).

RX_DV	RXD3	RXD[2:1]	RXD0
0 (valid only when RX_DV is low)	Duplex Status 0 = Half-duplex 1 = Full-duplex	RX_CLK clock speed 00 = 2.5MHz (10Mbps) 01 = 25MHz (100Mbps) 10 = 125MHz (1000Mbps) 11 = Reserved	Link Status 0 = Link down 1 = Link up

**Table 7. RGMII In-Band Status**

### MII Management (MIIM) Interface

The KSZ9031RNX supports the IEEE 802.3 MII Management interface, also known as the Management Data Input/Output (MDIO) interface. This interface allows upper-layer devices to monitor and control the state of the KSZ9031RNX. An external device with MIIM capability is used to read the PHY status and/or configure the PHY settings. More details about the MIIM interface can be found in Clause 22.2.4 of the IEEE 802.3 Specification.

The MIIM interface consists of the following:

- A physical connection that incorporates the clock line (MDC) and the data line (MDIO).
- A specific protocol that operates across the physical connection mentioned earlier, which allows an external controller to communicate with one or more KSZ9031RNX devices. Each KSZ9031RNX device is assigned a unique PHY address between 0h and 7h by the PHYAD[2:0] strapping pins.
- A 32-register address space for direct access to IEEE-defined registers and vendor-specific registers, and for indirect access to MMD addresses and registers. See the “[Register Map](#)” section.

PHY Address 0h is supported as the unique PHY address only; it is not supported as the broadcast PHY address, which allows for a single write command to simultaneously program an identical PHY register for two or more PHY devices (for example, using PHY Address 0h to set Register 0h to a value of 0x1940 to set Bit [11] to a value of one to enable software power-down). Instead, separate write commands are used to program each PHY device.

[Table 8](#) shows the MII Management frame format for the KSZ9031RNX.

	Preamble	Start of Frame	Read/Write OP Code	PHY Address Bits [4:0]	REG Address Bits [4:0]	TA	Data Bits [15:0]	Idle
<b>Read</b>	32 1's	01	10	00AAA	RRRRR	Z0	DDDDDDDD_DDDDDDDD	Z
<b>Write</b>	32 1's	01	01	00AAA	RRRRR	10	DDDDDDDD_DDDDDDDD	Z

**Table 8. MII Management Frame Format for the KSZ9031RNX**

## Interrupt (INT\_N)

The INT\_N pin is an optional interrupt signal that is used to inform the external controller that there has been a status update in the KSZ9031RNX PHY Register. Bits [15:8] of Register 1Bh are the interrupt control bits that enable and disable the conditions for asserting the INT\_N signal. Bits [7:0] of Register 1Bh are the interrupt status bits that indicate which interrupt conditions have occurred. The interrupt status bits are cleared after reading Register 1Bh.

Bit [14] of Register 1Fh sets the interrupt level to active high or active low. The default is active low.

The MII Management bus option gives the MAC processor complete access to the KSZ9031RNX control and status registers. Additionally, an interrupt pin eliminates the need for the processor to poll the PHY for status change.

## LED Mode

The KSZ9031RNX provides two programmable LED output pins, LED2 and LED1, which are configurable to support two LED modes. The LED mode is configured by the LED\_MODE strap-in (Pin 41). It is latched at power-up/reset and is defined as follows:

- Pull-up: Single-LED mode
- Pull-down: Tri-color dual-LED mode

### Single-LED Mode

In single-LED mode, the LED2 pin indicates the link status while the LED1 pin indicates the activity status, as shown in [Table 9](#).

LED Pin	Pin State	LED Definition	Link/Activity
LED2	H	OFF	Link off
	L	ON	Link on (any speed)
LED1	H	OFF	No activity
	Toggle	Blinking	Activity (RX, TX)

**Table 9. Single-LED Mode – Pin Definition**

### Tri-color Dual-LED Mode

In tri-color dual-LED mode, the link and activity status are indicated by the LED2 pin for 1000Base-T; by the LED1 pin for 100Base-TX; and by both LED2 and LED1 pins, working in conjunction, for 10Base-T. This is summarized in [Table 10](#).

LED Pin (State)		LED Pin (Definition)		Link/Activity
LED2	LED1	LED2	LED1	
H	H	OFF	OFF	Link off
L	H	ON	OFF	1000 Link / No activity
Toggle	H	Blinking	OFF	1000 Link / Activity (RX, TX)
H	L	OFF	ON	100 Link / No activity
H	Toggle	OFF	Blinking	100 Link / Activity (RX, TX)
L	L	ON	ON	10 Link / No activity
Toggle	Toggle	Blinking	Blinking	10 Link / Activity (RX, TX)

**Table 10. Tri-color Dual-LED Mode – Pin Definition**

Each LED output pin can directly drive an LED with a series resistor (typically 220Ω to 470Ω).

## Loopback Mode

The KSZ9031RNX supports the following loopback operations to verify analog and/or digital data paths.

- Local (digital) loopback
- Remote (analog) loopback

### Local (Digital) Loopback

This loopback mode checks the RGMII transmit and receive data paths between KSZ9031RNX and external MAC, and is supported for all three speeds (10/100/1000Mbps) at full-duplex.

The loopback data path is shown in [Figure 5](#).

- RGMII MAC transmits frames to KSZ9031RNX.
- Frames are wrapped around inside KSZ9031RNX.
- KSZ9031RNX transmits frames back to RGMII MAC.

**Figure 5. Local (Digital) Loopback**

The following programming steps and register settings are used for local loopback mode.

For 1000Mbps loopback,

- Set Register 0h,
  - Bit [14] = 1 // Enable local loopback mode
  - Bits [6, 13] = 10 // Select 1000Mbps speed
  - Bit [12] = 0 // Disable auto-negotiation
  - Bit [8] = 1 // Select full-duplex mode
- Set Register 9h,
  - Bit [12] = 1 // Enable master-slave manual configuration
  - Bit [11] = 0 // Select slave configuration (required for loopback mode)

For 10/100Mbps loopback,

- Set Register 0h,
  - Bit [14] = 1 // Enable local loopback mode
  - Bits [6, 13] = 00 / 01 // Select 10Mbps/100Mbps speed
  - Bit [12] = 0 // Disable auto-negotiation
  - Bit [8] = 1 // Select full-duplex mode

## Remote (Analog) Loopback

This loopback mode checks the line (differential pairs, transformer, RJ-45 connector, Ethernet cable) transmit and receive data paths between KSZ9031RNX and its link partner, and is supported for 1000Base-T full-duplex mode only.

The loopback data path is shown in [Figure 6](#).

- The Gigabit PHY link partner transmits frames to KSZ9031RNX.
- Frames are wrapped around inside KSZ9031RNX.
- KSZ9031RNX transmits frames back to the Gigabit PHY link partner.

**Figure 6. Remote (Analog) Loopback**

The following programming steps and register settings are used for remote loopback mode.

- Set Register 0h,
  - Bits [6, 13] = 10 // Select 1000Mbps speed
  - Bit [12] = 0 // Disable auto-negotiation
  - Bit [8] = 1 // Select full-duplex mode

Or just auto-negotiate and link up at 1000Base-T full-duplex mode with link partner.
- Set Register 11h,
  - Bit [8] = 1 // Enable remote loopback mode

## LinkMD® Cable Diagnostic

The LinkMD function uses time domain reflectometry (TDR) to analyze the cabling plant for common cabling problems, such as open circuits, short circuits, and impedance mismatches.

LinkMD operates by sending a pulse of known amplitude and duration down the selected differential pair, then analyzing the polarity and shape of the reflected signal to determine the type of fault: open circuit for a positive/non-inverted amplitude reflection and short circuit for a negative/inverted amplitude reflection. The time duration for the reflected signal to return provides the approximate distance to the cabling fault. The LinkMD function processes this TDR information and presents it as a numerical value that can be translated to a cable distance.

LinkMD is initiated by accessing Register 12h, the LinkMD – Cable Diagnostic register, in conjunction with Register 1Ch, the Auto MDI/MDI-X register. The latter register is needed to disable the Auto MDI/MDI-X function before running the LinkMD test. Additionally, a software reset (Reg. 0h, Bit [15] = 1) should be performed before and after running the LinkMD test. The reset helps to ensure the KSZ9031RNX is in the normal operating state before and after the test.

## NAND Tree Support

The KSZ9031RNX provides parametric NAND tree support for fault detection between chip I/Os and board. NAND tree mode is enabled at power-up/reset with the MODE[3:0] strap-in pins set to '0100'.

[Table 11](#) lists the NAND tree pin order.

Pin	Description
LED2	Input
LED1/PME_N1	Input
TXD0	Input
TXD1	Input
TXD2	Input
TXD3	Input
GTX_CLK	Input
TX_EN	Input
RX_DV	Input
RX_CLK	Input
INT_N/PME_N2	Input
MDC	Input
MDIO	Input
CLK125_NDO	Output

**Table 11. NAND Tree Test Pin Order for KSZ9031RNX**

## Power Management

The KSZ9031RNX incorporates a number of power-management modes and features that provide methods to consume less energy. These are discussed in the following sections.

### Energy-Detect Power-Down Mode

Energy-detect power-down (EDPD) mode is used to further reduce the transceiver power consumption when the cable is unplugged. It is enabled by writing a one to MMD Address 1Ch, Register 23h, Bit [0], and is in effect when auto-negotiation mode is enabled and the cable is disconnected (no link).

In EDPD Mode, the KSZ9031RNX shuts down all transceiver blocks, except for the transmitter and energy detect circuits. Power can be reduced further by extending the time interval between the transmissions of link pulses to check for the presence of a link partner. The periodic transmission of link pulses is needed to ensure the KSZ9031RNX and its link partner, when operating in the same low-power state and with Auto MDI/MDI-X disabled, can wake up when the cable is connected between them. By default, EDPD mode is disabled after power-up.

### Software Power-Down Mode

This mode is used to power down the KSZ9031RNX device when it is not in use after power-up. Software power-down (SPD) mode is enabled by writing a one to Register 0h, Bit [11]. In the SPD state, the KSZ9031RNX disables all internal functions, except for the MII management interface. The KSZ9031RNX exits the SPD state after a zero is written to Register 0h, Bit [11].

### Chip Power-Down Mode

This mode provides the lowest power state for the KSZ9031RNX device when it is mounted on the board but not in use. Chip power-down (CPD) mode is enabled after power-up/reset with the MODE[3:0] strap-in pins set to '0111'. The KSZ9031RNX exits CPD mode after a hardware reset is applied to the RESET\_N pin (Pin 42) with the MODE[3:0] strap-in pins set to an operating mode other than CPD.

## Energy Efficient Ethernet (EEE)

The KSZ9031RNX implements Energy Efficient Ethernet (EEE) as described in IEEE Standard 802.3az for line signaling by the four differential pairs (analog side) and according to the multisource agreement (MSA) of collaborating Gigabit Ethernet chip vendors for the RGMII (digital side). This agreement is based on the IEEE Standard's EEE implementation for GMII (1000Mbps) and MII (100Mbps). The specification is defined around an EEE-compliant MAC on the host side and an EEE-compliant link partner on the line side that support the special signaling associated with EEE. EEE saves power by keeping the AC signal on the copper Ethernet cable at approximately 0V peak-to-peak as often as possible during periods of no traffic activity, while maintaining the link-up status. This is referred to as low-power idle (LPI) mode or state.

During LPI mode, the copper link responds automatically when it receives traffic and resumes normal PHY operation immediately, without blockage of traffic or loss of packet. This involves exiting LPI mode and returning to normal 100/1000Mbps operating mode. Wake-up times are <16μs for 1000Base-T and <30μs for 100Base-TX.

The LPI state is controlled independently for transmit and receive paths, allowing the LPI state to be active (enabled) for:

- Transmit cable path only
- Receive cable path only
- Both transmit and receive cable paths

The KSZ9031RNX has the EEE function disabled as the power-up default setting. The EEE function is enabled by setting the following EEE advertisement bits at MMD Address 7h, Register 3Ch, followed by restarting auto-negotiation (writing a '1' to Register 0h, Bit [9]):

- Bit [2] = 1 // Enable 1000Mbps EEE mode
- Bit [1] = 1 // Enable 100Mbps EEE mode

For standard (non-EEE) 10Base-T mode, normal link pulses (NLPs) with long periods of no AC signal transmission are used to maintain the link during the idle period when there is no traffic activity. To save more power, the KSZ9031RNX provides the option to enable 10Base-Te mode, which saves additional power by reducing the transmitted signal amplitude from 2.5V to 1.75V. To enable 10Base-Te mode, write a '1' to MMD Address 1Ch, Register 4h, Bit [10].

During LPI mode, refresh transmissions are used to maintain the link; power savings occur in quiet periods. Approximately every 20 to 22 milliseconds, a refresh transmission of 200 to 220 microseconds is sent to the link partner. The refresh transmissions and quiet periods are shown in [Figure 7](#).

**Figure 7. LPI Mode (Refresh Transmissions and Quiet Periods)**

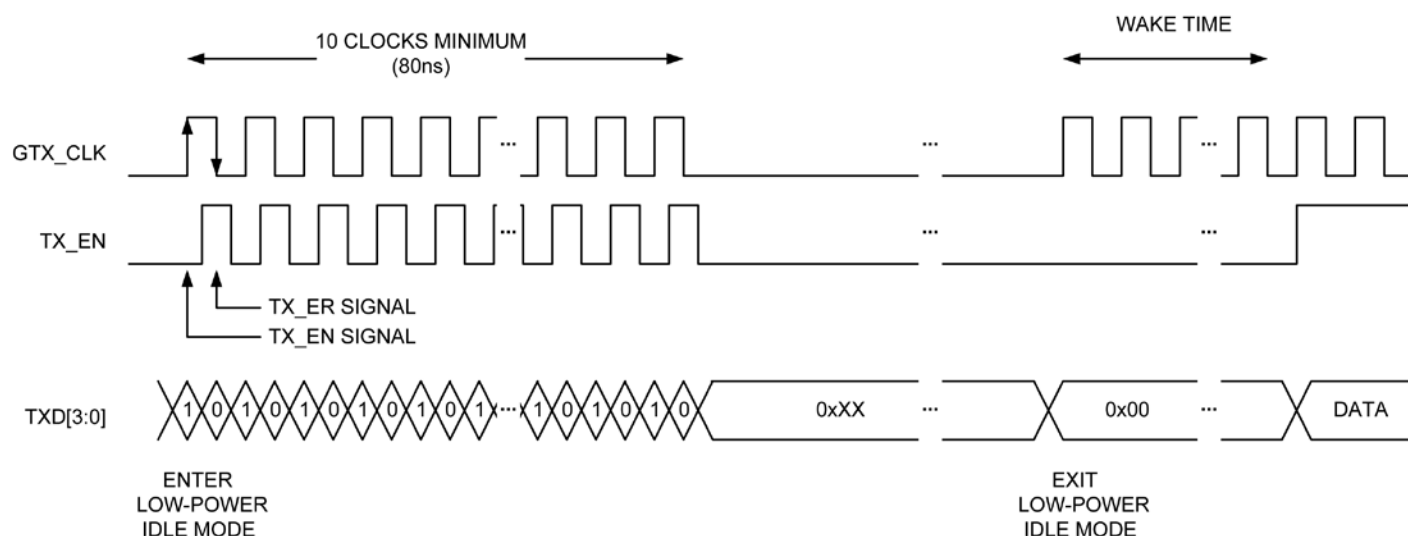

### Transmit Direction Control (MAC-to-PHY)

RGMII 1000Mbps transmission from MAC-to-PHY uses both rising and falling edges of the GTX\_CLK clock. The KSZ9031RNX uses the TX\_EN pin as the RGMII transmit control signal (TX\_CTL) to clock in the TX\_EN signal on the rising edge and the TX\_ER signal on the falling edge. It also uses the TXD[3:0] pins to clock in the TX data low nibble bits [3:0] on the rising edge and the TX data high nibble Bits [7:4] on the falling edge.

The KSZ9031RNX enters LPI mode for the transmit direction when its attached EEE-compliant MAC de-asserts the TX\_EN signal (the TX\_CTL pin outputs low on the rising edge), asserts the TX\_ER signal (the TX\_CTL pin outputs high on the falling edge), and sets TX data Bits [7:0] to 0000\_0001 (TXD[3:0] pins output 0001 on the rising edge and 0000 on the falling edge). The KSZ9031RNX remains in the 1000Mbps transmit LPI state while the MAC maintains the states of these signals. When the MAC changes any of the TX\_EN, TX\_ER, or TX data signals from their LPI state values, the KSZ9031RNX exits the LPI transmit state.

To save more power, the MAC can stop the GTX\_CLK clock after the RGMII signals for the LPI state have been asserted for 10 or more GTX\_CLK clock cycles.

[Figure 8](#) shows the LPI transition for RGMII transmit in 1000Mbps mode.

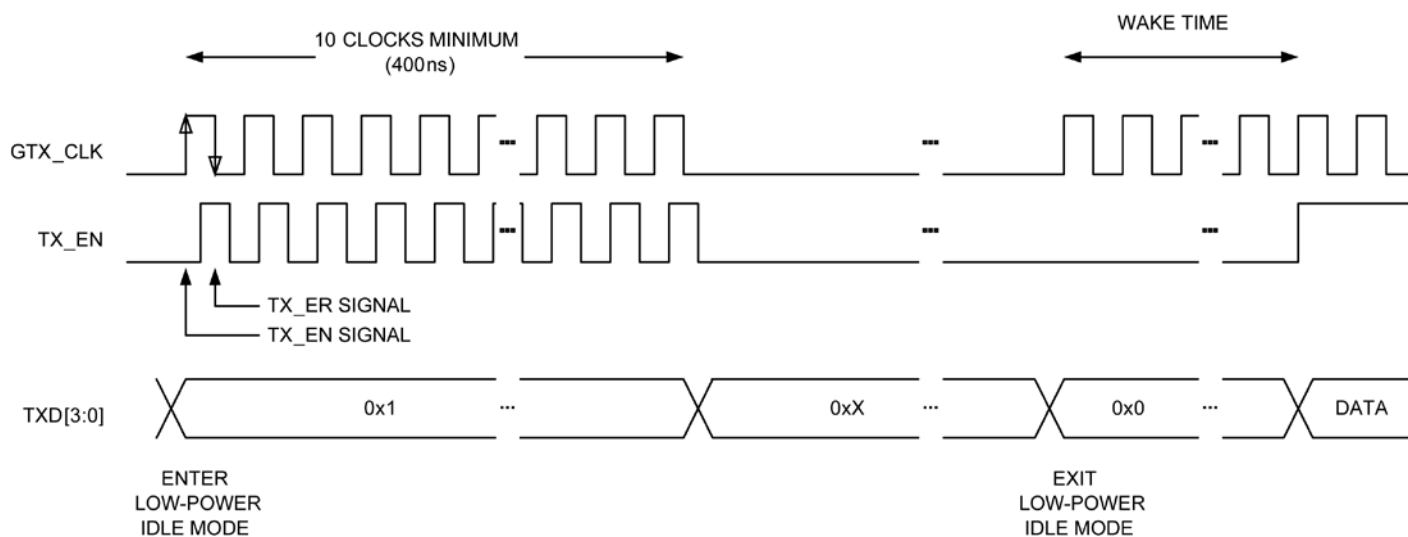

**Figure 8. LPI Transition – RGMII (1000Mbps) Transmit**

RGMII 100Mbps transmission from MAC-to-PHY uses both rising and falling edges of the GTX\_CLK clock. The KSZ9031RX uses the TX\_EN pin as the RGMII transmit control signal (TX\_CTL) to clock in the TX\_EN signal on the rising edge and the TX\_ER signal on the falling edge. It also uses the TXD[3:0] pins to clock in the TX data Bits [3:0] on the rising edge.

The KSZ9031RNX enters LPI mode for the transmit direction when its attached IEEE-compliant MAC de-asserts the TX\_EN signal (the TX\_CTL pin outputs low on the rising edge), asserts the TX\_ER signal (the TX\_CTL pin outputs high on the falling edge), and sets TX data Bits [3:0] to 0001 (the TXD[3:0] pins output 0001). The KSZ9031RNX remains in the 100Mbps transmit LPI state while the MAC maintains the states of these signals. When the MAC changes any of the TX\_EN, TX\_ER, or TX data signals from their LPI state values, the KSZ9031RNX exits the LPI transmit state.

To save more power, the MAC can stop the GTX\_CLK clock after the RGMII signals for the LPI state have been asserted for 10 or more GTX\_CLK clock cycles.

Figure 9 shows the LPI transition for RGMII transmit in 100Mbps mode.

**Figure 9. LPI Transition – RGMII (100Mbps) Transmit**

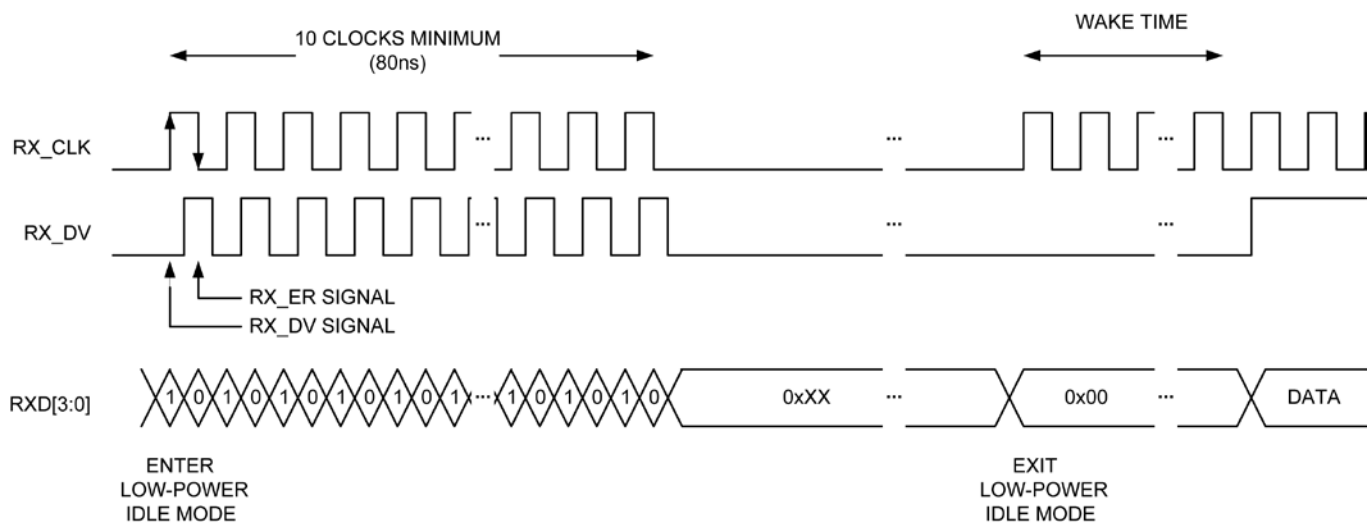

## Receive Direction Control (PHY-to-MAC)

RGMII 1000Mbps transmission from PHY-to-MAC uses both rising and falling edges of the RX\_CLK clock. The KSZ9031RNX uses the RX\_DV pin as the RGMII receive control signal (RX\_CTL) to clock out the RX\_DV signal on the rising edge and the RX\_ER signal on the falling edge. It also uses the RXD[3:0] pins to clock out the RX data low nibble Bits [3:0] on the rising edge and the RX data high nibble Bits [7:4] on the falling edge.

The KSZ9031RNX enters LPI mode for the receive direction when it receives the /P/ code bit pattern (sleep/refresh) from its IEEE-compliant link partner. It then drives the RX\_DV pin low on the rising clock edge and high on the falling clock edge to de-assert the RX\_DV signal and assert the RX\_ER signal, respectively, to the MAC. Also, the RXD[3:0] pins are driven to 0001 on the rising clock edge and 0000 on the falling clock edge to set the RX data Bits [7:0] to 0000\_0001. The KSZ9031RNX remains in the 1000Mbps receive LPI state while it continues to receive the refresh from its link partner, so it will continue to maintain and drive the LPI output states for the RGMII receive output pins to inform the attached IEEE-compliant MAC that it is in the receive LPI state. When the KSZ9031RNX receives a non /P/ code bit pattern (non Refresh), it exits the receive LPI state and sets the RX\_DV and RXD[3:0] output pins accordingly for a normal frame or normal idle.

To save more power, the KSZ9031RNX stops the RX\_CLK clock output to the MAC after 10 or more RX\_CLK clock cycles have occurred in the receive LPI state.

Figure 10 shows the LPI transition for RGMII receive in 1000Mbps mode.

**Figure 10. LPI Transition – RGMII (1000Mbps) Receive**

RGMII 100Mbps transmission from PHY-to-MAC uses both rising and falling edges of the RX\_CLK clock. The KSZ9031RNX uses the RX\_DV pin as the RGMII receive control signal (RX\_CTL) to clock out the RX\_DV signal on the rising edge and the RX\_ER signal on the falling edge. It also uses the RXD[3:0] pins to clock out the RX data Bits [3:0] on the rising edge.

The KSZ9031RNX enters LPI mode for the receive direction when it receives the /P/ code bit pattern (sleep/refresh) from its IEEE-compliant link partner. It then drives the RX\_DV pin low on the rising clock edge and high on the falling clock edge to de-assert the RX\_DV signal and assert the RX\_ER signal, respectively, to the MAC. Also, the RXD[3:0] pins are driven to 0001. The KSZ9031RNX remains in the 100Mbps receive LPI state while it continues to receive the refresh from its link partner, so it will continue to maintain and drive the LPI output states for the RGMII receive output pins to inform the attached IEEE-compliant MAC that it is in the receive LPI state. When the KSZ9031RNX receives a non /P/ code bit pattern (non-refresh), it exits the receive LPI state and sets the RX\_DV and RXD[3:0] output pins accordingly for a normal frame or normal idle.

The KSZ9031RNX stops the RX\_CLK clock output to the MAC after 10 or more RX\_CLK clock cycles have occurred in the receive LPI state to save more power.

Figure 11 shows the LPI transition for RGMII receive in 100Mbps mode.

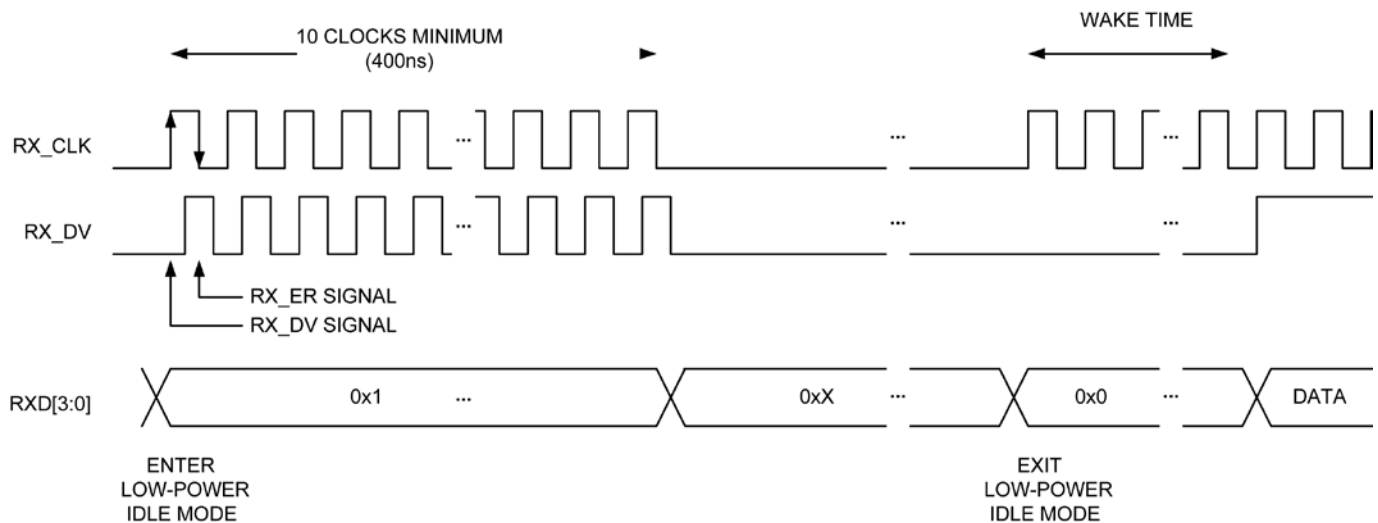

Figure 11. LPI Transition – RGMII (100Mbps) Receive

### Registers Associated with EEE

The following MMD registers are provided for EEE configuration and management:

- MMD Address 3h, Register 0h - PCS EEE – Control register
- MMD Address 3h, Register 1h - PCS EEE – Status register
- MMD Address 7h, Register 3Ch - EEE Advertisement register
- MMD Address 7h, Register 3Dh - EEE Link Partner Advertisement register

### Wake-On-LAN

Wake-On-LAN (WOL) is normally a MAC-based function to wake up a host system (for example, an Ethernet end device, such as a PC) that is in standby power mode. Wake-up is triggered by receiving and detecting a special packet (commonly referred to as the “magic packet”) that is sent by the remote link partner. The KSZ9031RNX can perform the same WOL function if the MAC address of its associated MAC device is entered into the KSZ9031RNX PHY registers for magic-packet detection. When the KSZ9031RNX detects the magic packet, it wakes up the host by driving its power management event (PME) output pin low.

By default, the WOL function is disabled. It is enabled by setting the enabling bit and configuring the associated registers for the selected PME wake-up detection method.

The KSZ9031RNX provides three methods to trigger a PME wake-up:

- Magic-packet detection
- Customized-packet detection
- Link status change detection

### Magic-Packet Detection

The magic packet’s frame format starts with 6 bytes of 0xFFh and is followed by 16 repetitions of the MAC address of its associated MAC device (local MAC device).

When the magic packet is detected from its link partner, the KSZ9031RNX asserts its PME output pin low.

The following MMD Address 2h registers are provided for magic-packet detection:

- Magic-packet detection is enabled by writing a ‘1’ to MMD Address 2h, Register 10h, Bit [6]
- The MAC address (for the local MAC device) is written to and stored in MMD Address 2h, Registers 11h – 13h

The KSZ9031RNX does not generate the magic packet. The magic packet must be provided by the external system.

## Customized-Packet Detection

The customized packet has associated register/bit masks to select which byte, or bytes, of the first 64 bytes of the packet to use in the CRC calculation. After the KSZ9031RNX receives the packet from its link partner, the selected bytes for the received packet are used to calculate the CRC. The calculated CRC is compared to the expected CRC value that was previously written to and stored in the KSZ9031RNX PHY registers. If there is a match, the KSZ9031RNX asserts its PME output pin low.

Four customized packets are provided to support four types of wake-up scenarios. A dedicated set of registers is used to configure and enable each customized packet.

The following MMD registers are provided for customized-packet detection:

- Each of the four customized packets is enabled via MMD Address 2h, Register 10h,
  - Bit [2] // For customized packets, type 0
  - Bit [3] // For customized packets, type 1
  - Bit [4] // For customized packets, type 2
  - Bit [5] // For customized packets, type 3
- 32-bit expected CRCs are written to and stored in:
  - MMD Address 2h, Registers 14h – 15h // For customized packets, type 0
  - MMD Address 2h, Registers 16h – 17h // For customized packets, type 1
  - MMD Address 2h, Registers 18h – 19h // For customized packets, type 2
  - MMD Address 2h, Registers 1Ah – 1Bh // For customized packets, type 3
- Masks to indicate which of the first 64-bytes to use in the CRC calculation are set in:
  - MMD Address 2h, Registers 1Ch – 1Fh // For customized packets, type 0
  - MMD Address 2h, Registers 20h – 23h // For customized packets, type 1
  - MMD Address 2h, Registers 24h – 27h // For customized packets, type 2
  - MMD Address 2h, Registers 28h – 2Bh // For customized packets, type 3

## Link Status Change Detection

If link status change detection is enabled, the KSZ9031RNX asserts its PME output pin low whenever there is a link status change, using the following MMD Address 2h register bits and their enabled (1) or disabled (0) settings:

- MMD Address 2h, Register 10h, Bit [0] // For link-up detection
- MMD Address 2h, Register 10h, Bit [1] // For link-down detection

The PME output signal is available on either LED1/PME\_N1 (Pin 17) or INT\_N/PME\_N2 (Pin 38), and is selected and enabled using MMD Address 2h, Register 2h, Bits [8] and [10], respectively. Additionally, MMD Address 2h, Register 10h, Bits [15:14] defines the output functions for Pins 17 and 38.

The PME output is active low and requires a 1kΩ pull-up to the VDDIO supply. When asserted, the PME output is cleared by disabling the register bit that enabled the PME trigger source (magic packet, customized packet, link status change).

## Typical Current/Power Consumption

Table 12 through Table 15 show the typical current consumption by the core (DVDDL, AVDDL, AVDDL\_PLL), transceiver (AVDDH) and digital I/O (DVDDH) supply pins, and the total typical power for the entire KSZ9031RNX device for various nominal operating voltage combinations.

### Transceiver (3.3V), Digital I/Os (3.3V)

Condition	1.2V Core (DVDDL, AVDDL, AVDDL_PLL)	3.3V Transceiver (AVDDH)	3.3V Digital I/Os (DVDDH)	Total Chip Power
	mA	mA	mA	mW
1000Base-T link-up (no traffic)	210	67.4	19.5	538
1000Base-T full-duplex @ 100% utilization	221	66.3	41.5	621
100Base-TX link-up (no traffic)	63.6	28.7	13.9	217
100Base-TX full-duplex @ 100% utilization	63.8	28.6	17.2	228
10Base-T link-up (no traffic)	7.1	15.9	11.5	99
10Base-T full-duplex @ 100% utilization	7.7	28.6	13.7	149
EEE Mode – 1000Mbps	43.5	5.7	30.6	172
EEE Mode – 100Mbps (TX and RX in LPI)	25.6	5.3	18.1	108
Software power-down mode (Reg. 0h.11 = 1)	1.0	4.2	9.3	46

Table 12. Typical Current/Power Consumption – Transceiver (3.3V), Digital I/Os (3.3V)

### Transceiver (3.3V), Digital I/Os (1.8V)

Condition	1.2V Core (DVDDL, AVDDL, AVDDL_PLL)	3.3V Transceiver (AVDDH)	1.8V Digital I/Os (DVDDH)	Total Chip Power
	mA	mA	mA	mW
1000Base-T link-up (no traffic)	210	67.4	11.2	494
1000Base-T full-duplex @ 100% utilization	221	66.3	23.6	526
100Base-TX link-up (no traffic)	63.6	28.7	8.4	186
100Base-TX full-duplex @ 100% utilization	63.8	28.6	9.8	189
10Base-T link-up (no traffic)	7.1	15.9	3.6	67
10Base-T full-duplex @ 100% utilization	7.7	28.6	5.6	114
EEE Mode – 1000Mbps	43.5	5.7	15.9	100
EEE Mode – 100Mbps (TX and RX in LPI)	25.6	5.3	9.1	65
Software power-down mode (Reg. 0h.11 = 1)	1.0	4.2	5.5	25

Table 13. Typical Current/Power Consumption – Transceiver (3.3V), Digital I/Os (1.8V)

**Transceiver (2.5V), Digital I/Os (2.5V)**

Condition	1.2V Core (DVDDL, AVDDL, AVDDL_PLL)	2.5V Transceiver <sup>(1)</sup> (AVDDH – commercial temp only)	2.5V Digital I/Os (DVDDH)	Total Chip Power
	mA	mA	mA	mW
1000Base-T link-up (no traffic)	210	58.8	14.7	435
1000Base-T full-duplex @ 100% utilization	221	57.9	31.5	488
100Base-TX link-up (no traffic)	63.6	24.9	10.5	165
100Base-TX full-duplex @ 100% utilization	63.8	24.9	13.0	171
10Base-T link-up (no traffic)	7.1	11.5	6.3	53
10Base-T full-duplex @ 100% utilization	7.7	25.3	9.0	95
EEE Mode – 1000Mbps	43.5	4.5	23.6	122
EEE Mode – 100Mbps (TX and RX in LPI)	25.6	4.1	13.8	75
Software power-down mode (Reg. 0h.11 = 1)	1.0	3.1	6.7	26

**Table 14. Typical Current/Power Consumption – Transceiver (2.5V), Digital I/Os (2.5V)****Transceiver (2.5V), Digital I/Os (1.8V)**

Condition	1.2V Core (DVDDL, AVDDL, AVDDL_PLL)	2.5V Transceiver <sup>(1)</sup> (AVDDH – commercial temp only)	1.8V Digital I/Os (DVDDH)	Total Chip Power
	mA	mA	mA	mW
1000Base-T link-up (no traffic)	210	58.8	11.2	419
1000Base-T full-duplex @ 100% utilization	221	57.9	23.6	452
100Base-TX link-up (no traffic)	63.6	24.9	8.4	154
100Base-TX full-duplex @ 100% utilization	63.8	24.9	9.8	156
10Base-T link-up (no traffic)	7.1	11.5	3.6	44
10Base-T full-duplex @ 100% utilization	7.7	25.3	5.6	83
EEE Mode – 1000Mbps	43.5	4.5	15.9	92
EEE Mode – 100Mbps (TX and RX in LPI)	25.6	4.1	9.1	57
Software power-down mode (Reg. 0h.11 = 1)	1.0	3.1	5.5	19

**Table 15. Typical Current/Power Consumption – Transceiver (2.5V), Digital I/Os (1.8V)****Note:**

1. 2.5V AVDDH is recommended for commercial temperature range (0°C to +70°C) operation only.

## Register Map

The register space within the KSZ9031RNX consists of two distinct areas.

- Standard registers // Direct register access
- MDIO manageable device (MMD) registers // Indirect register access

The KSZ9031RNX supports the following standard registers.

Register Number (Hex)	Description
<b>IEEE-Defined Registers</b>	
0h	Basic Control
1h	Basic Status
2h	PHY Identifier 1
3h	PHY Identifier 2
4h	Auto-Negotiation Advertisement
5h	Auto-Negotiation Link Partner Ability
6h	Auto-Negotiation Expansion
7h	Auto-Negotiation Next Page
8h	Auto-Negotiation Link Partner Next Page Ability
9h	1000Base-T Control
Ah	1000Base-T Status
Bh – Ch	Reserved
Dh	MMD Access – Control
Eh	MMD Access – Register/Data
Fh	Extended Status
<b>Vendor-Specific Registers</b>	
10h	Reserved
11h	Remote Loopback
12h	LinkMD Cable Diagnostic
13h	Digital PMA/PCS Status
14h	Reserved
15h	RXER Counter
16h – 1Ah	Reserved
1Bh	Interrupt Control/Status
1Ch	Auto MDI/MDI-X
1Dh – 1Eh	Reserved
1Fh	PHY Control

**Table 16. Standard Registers Supported by KSZ9031RNX**

Table 17 highlights those MMD device addresses and their associated register addresses supported by the KSZ9031RNX, which make up the indirect MMD registers.

Device Address (Hex)	Register Address (Hex)	Description
1h	5Ah	1000Base-T Link-Up Time Control
2h	0h	Common Control
	1h	Strap Status
	2h	Operation Mode Strap Override
	3h	Operation Mode Strap Status
	4h	RGMII Control Signal Pad Skew
	5h	RGMII RX Data Pad Skew
	6h	RGMII TX Data Pad Skew
	8h	RGMII Clock Pad Skew
	10h	Wake-On-LAN – Control
	11h	Wake-On-LAN – Magic Packet, MAC-DA-0
	12h	Wake-On-LAN – Magic Packet, MAC-DA-1
	13h	Wake-On-LAN – Magic Packet, MAC-DA-2
	14h	Wake-On-LAN – Customized Packet, Type 0, Expected CRC 0
	15h	Wake-On-LAN – Customized Packet, Type 0, Expected CRC 1
	16h	Wake-On-LAN – Customized Packet, Type 1, Expected CRC 0
	17h	Wake-On-LAN – Customized Packet, Type 1, Expected CRC 1
	18h	Wake-On-LAN – Customized Packet, Type 2, Expected CRC 0
	19h	Wake-On-LAN – Customized Packet, Type 2, Expected CRC 1
	1Ah	Wake-On-LAN – Customized Packet, Type 3, Expected CRC 0
	1Bh	Wake-On-LAN – Customized Packet, Type 3, Expected CRC 1
	1Ch	Wake-On-LAN – Customized Packet, Type 0, Mask 0
	1Dh	Wake-On-LAN – Customized Packet, Type 0, Mask 1
	1Eh	Wake-On-LAN – Customized Packet, Type 0, Mask 2
	1Fh	Wake-On-LAN – Customized Packet, Type 0, Mask 3
	20h	Wake-On-LAN – Customized Packet, Type 1, Mask 0
	21h	Wake-On-LAN – Customized Packet, Type 1, Mask 1
	22h	Wake-On-LAN – Customized Packet, Type 1, Mask 2
	23h	Wake-On-LAN – Customized Packet, Type 1, Mask 3
	24h	Wake-On-LAN – Customized Packet, Type 2, Mask 0
	25h	Wake-On-LAN – Customized Packet, Type 2, Mask 1
	26h	Wake-On-LAN – Customized Packet, Type 2, Mask 2
	27h	Wake-On-LAN – Customized Packet, Type 2, Mask 3
	28h	Wake-On-LAN – Customized Packet, Type 3, Mask 0
	29h	Wake-On-LAN – Customized Packet, Type 3, Mask 1
	2Ah	Wake-On-LAN – Customized Packet, Type 3, Mask 2
	2Bh	Wake-On-LAN – Customized Packet, Type 3, Mask 3
3h	0h	PCS EEE – Control
	1h	PCS EEE – Status
7h	3Ch	EEE Advertisement
	3Dh	EEE Link Partner Advertisement
1Ch	4h	Analog Control 4
	23h	EDPD Control

Table 17. MMD Registers Supported by KSZ9031RNX

## Standard Registers

Standard registers provide direct read/write access to a 32-register address space, as defined in Clause 22 of the IEEE 802.3 Specification. Within this address space, the first 16 registers (Registers 0h to Fh) are defined according to the IEEE specification, while the remaining 16 registers (Registers 10h to 1Fh) are defined specific to the PHY vendor.

### IEEE Defined Registers – Descriptions

Address	Name	Description	Mode <sup>(1)</sup>	Default
<b>Register 0h – Basic Control</b>				
0.15	Reset	1 = Software PHY reset 0 = Normal operation This bit is self-cleared after a '1' is written to it.	RW/SC	0
0.14	Loopback	1 = Loopback mode 0 = Normal operation	RW	0
0.13	Speed Select (LSB)	[0.6, 0.13] [1,1] = Reserved [1,0] = 1000Mbps [0,1] = 100Mbps [0,0] = 10Mbps This bit is ignored if auto-negotiation is enabled (Reg. 0.12 = 1).	RW	0
0.12	Auto-Negotiation Enable	1 = Enable auto-negotiation process 0 = Disable auto-negotiation process If enabled, auto-negotiation result overrides settings in Reg. 0.13, 0.8 and 0.6.	RW	1
0.11	Power-Down	1 = Power-down mode 0 = Normal operation When this bit is set to '1', the link-down status might not get updated in the PHY register. Software should note link is down and should not rely on the PHY register link status. After this bit is changed from '1' to '0', an internal global reset is automatically generated. Wait a minimum of 1ms before read/write access to the PHY registers.	RW	0
0.10	Isolate	1 = Electrical isolation of PHY from RGMII 0 = Normal operation	RW	0
0.9	Restart Auto-Negotiation	1 = Restart auto-negotiation process 0 = Normal operation This bit is self-cleared after a '1' is written to it.	RW/SC	0
0.8	Duplex Mode	1 = Full-duplex 0 = Half-duplex	RW	1
0.7	Reserved	Reserved	RW	0

**IEEE Defined Registers – Descriptions (Continued)**

Address	Name	Description	Mode <sup>(1)</sup>	Default
0.6	Speed Select (MSB)	[0.6, 0.13] [1,1] = Reserved [1,0] = 1000Mbps [0,1] = 100Mbps [0,0] = 10Mbps  This bit is ignored if auto-negotiation is enabled (Reg. 0.12 = 1).	RW	Set by MODE[3:0] strapping pins. See the “ <a href="#">Strapping Options</a> ” section for details.
0.5:0	Reserved	Reserved	RO	00_0000
<b>Register 1h – Basic Status</b>				
1.15	100Base-T4	1 = T4 capable 0 = Not T4 capable	RO	0
1.14	100Base-TX Full-Duplex	1 = Capable of 100Mbps full-duplex 0 = Not capable of 100Mbps full-duplex	RO	1
1.13	100Base-TX Half-Duplex	1 = Capable of 100Mbps half-duplex 0 = Not capable of 100Mbps half-duplex	RO	1
1.12	10Base-T Full-Duplex	1 = Capable of 10Mbps full-duplex 0 = Not capable of 10Mbps full-duplex	RO	1
1.11	10Base-T Half-Duplex	1 = Capable of 10Mbps half-duplex 0 = Not capable of 10Mbps half-duplex	RO	1
1.10:9	Reserved	Reserved	RO	00
1.8	Extended Status	1 = Extended status info in Reg. 15h. 0 = No extended status info in Reg. 15h.	RO	1
1.7	Reserved	Reserved	RO	0
1.6	No Preamble	1 = Preamble suppression 0 = Normal preamble	RO	1
1.5	Auto-Negotiation Complete	1 = Auto-negotiation process completed 0 = Auto-negotiation process not completed	RO	0
1.4	Remote Fault	1 = Remote fault 0 = No remote fault	RO/LH	0
1.3	Auto-Negotiation Ability	1 = Can perform auto-negotiation 0 = Cannot perform auto-negotiation	RO	1
1.2	Link Status	1 = Link is up 0 = Link is down	RO/LL	0
1.1	Jabber Detect	1 = Jabber detected 0 = Jabber not detected (default is low)	RO/LH	0
1.0	Extended Capability	1 = Supports extended capability registers	RO	1
<b>Register 2h – PHY Identifier 1</b>				
2.15:0	PHY ID Number	Assigned to Bits [3:18] of the organizationally unique identifier (OUI). KENDIN Communication's OUI is 0010A1h.	RO	0022h

**IEEE Defined Registers – Descriptions (Continued)**

Address	Name	Description	Mode <sup>(1)</sup>	Default
<b>Register 3h – PHY Identifier 2</b>

A.10	Link Partner 1000Base-T Half-Duplex Capability	1 = Link partner is capable of 1000Base-T half-duplex 0 = Link Partner is not capable of 1000Base-T half-duplex	RO	0
A.9:8	Reserved	Reserved	RO	00
A.7:0	Idle Error Count	Cumulative count of errors detected when receiver is receiving idles and PMA_TXMODE.indicate = SEND_N. The counter is incremented every symbol period that rxerror_status = ERROR.	RO/SC	0000_0000

**IEEE Defined Registers – Descriptions (Continued)**

Address	Name	Description	Mode <sup>(1)</sup>	Default
<b>Register Dh – MMD Access – Control</b>				
D.15:14	MMD – Operation Mode	For the selected MMD device address (Bits [4:0] of this register), these two bits select one of the following register or data operations and the usage for MMD Access – Register/Data (Reg. Eh). 00 = Register 01 = Data, no post increment 10 = Data, post increment on reads and writes 11 = Data, post increment on writes only	RW	00
D.13:5	Reserved	Reserved	RW	00_0000_000
D.4:0	MMD – Device Address	These five bits set the MMD device address.	RW	0_0000
<b>Register Eh – MMD Access – Register/Data</b>				
E.15:0	MMD – Register/Data	For the selected MMD device address (Reg. Dh, Bits [4:0]),  When Reg. Dh, Bits [15:14] = 00, this register contains the read/write register address for the MMD device address.  Otherwise, this register contains the read/write data value for the MMD device address and its selected register address.  See also Reg. Dh, Bits [15:14], for descriptions of post increment reads and writes of this register for data operation.	RW	0000_0000_0000_0000
<b>Register Fh – Extended Status</b>				
F.15	1000Base-X Full-Duplex	1 = PHY can perform 1000Base-X full-duplex 0 = PHY cannot perform 1000Base-X full-duplex	RO	0
F.14	1000Base-X Half-Duplex	1 = PHY can perform 1000Base-X half-duplex 0 = PHY cannot perform 1000Base-X half-duplex	RO	0
F.13	1000Base-T Full-Duplex	1 = PHY can perform 1000Base-T full-duplex 0 = PHY cannot perform 1000Base-T full-duplex	RO	1
F.12	1000Base-T Half-Duplex	1 = PHY can perform 1000Base-T half-duplex 0 = PHY cannot perform 1000Base-T half-duplex	RO	1
F.11:0	Reserved	Ignore when read	RO	–

**Note:**

1. RW = Read/Write.  
RO = Read only.  
SC = Self-cleared.  
LH = Latch high.  
LL = Latch low.

**Vendor-Specific Registers – Descriptions**

Address	Name	Description	Mode <sup>(1)</sup>	Default
<b>Register 11h – Remote Loopback</b>				
11.15:9	Reserved	Reserved	RW	0000_000
11.8	Remote Loopback	1 = Enable remote loopback 0 = Disable remote loopback	RW	0
11.7:1	Reserved	Reserved	RW	1111_010
11.0	Reserved	Reserved	RO	0
<b>Register 12h – LinkMD – Cable Diagnostic</b>				
12.15	Cable Diagnostic Test Enable	Write value: 1 = Enable cable diagnostic test. After test has completed, this bit is self-cleared. 0 = Disable cable diagnostic test. Read value: 1 = Cable diagnostic test is in progress. 0 = Indicates cable diagnostic test (if enabled) has completed and the status information is valid for read.	RW/SC	0
12.14	Reserved	This bit should always be set to '0'.	RW	0
12.13:12	Cable Diagnostic Test Pair	These two bits select the differential pair for testing: 00 = Differential pair A (Pins 2, 3) 01 = Differential pair B (Pins 5, 6) 10 = Differential pair C (Pins 7, 8) 11 = Differential pair D (Pins 10, 11)	RW	00
12.11:10	Reserved	These two bits should always be set to '00'.	RW	00
12.9:8	Cable Diagnostic Status	These two bits represent the test result for the selected differential pair in Bits [13:12] of this register. 00 = Normal cable condition (no fault detected) 01 = Open cable fault detected 10 = Short cable fault detected 11 = Reserved	RO	00
12.7:0	Cable Diagnostic Fault Data	For the open or short cable fault detected in Bits [9:8] of this register, this 8-bit value represents the distance to the cable fault.	RO	0000_0000

**Note:**

1. RW = Read/Write.  
RC = Read-cleared  
RO = Read only.  
SC = Self-cleared.  
LH = Latch high.

## MMD Registers

MMD registers provide indirect read/write access to up to 32 MMD device addresses with each device supporting up to 65,536 16-bit registers, as defined in Clause 22 of the IEEE 802.3 Specification. The KSZ9031RNX, however, uses only a small fraction of the available registers. See the “[Register Map](#)” section for a list of supported MMD device addresses and their associated register addresses.

The following two standard registers serve as the portal registers to access the indirect MMD registers.

- Standard Register Dh – MMD Access – Control
- Standard Register Eh – MMD Access – Register/Data

Address	Name	Description	Mode	Default
<b>Register Dh – MMD Access – Control</b>				
D.15:14	MMD – Operation Mode	For the selected MMD device address (Bits [4:0] of this register), these two bits select one of the following register or data operations and the usage for MMD Access – Register/Data (Reg. Eh). 00 = Register 01 = Data, no post increment 10 = Data, post increment on reads and writes 11 = Data, post increment on writes only	RW	00
D.13:5	Reserved	Reserved	RW	00_0000_000
D.4:0	MMD – Device Address	These five bits set the MMD device address.	RW	0_0000
<b>Register Eh – MMD Access – Register/Data</b>				
E.15:0	MMD – Register/Data	For the selected MMD device address (Reg. Dh, Bits [4:0]),  When Reg. Dh, Bits [15:14] = 00, this register contains the read/write register address for the MMD device address.  Otherwise, this register contains the read/write data value for the MMD device address and its selected register address.  See also Register Dh, Bits [15:14] descriptions for post increment reads and writes of this register for data operation.	RW	0000_0000_0000_0000

**Table 18. Portal Registers (Access to Indirect MMD Registers)**

Examples:

- **MMD Register Write**

Write MMD – Device Address 2h, Register 10h = 0001h to enable link-up detection to trigger PME for WOL.

1. Write Register Dh with 0002h // Set up register address for MMD – Device Address 2h.
2. Write Register Eh with 0010h // Select Register 10h of MMD – Device Address 2h.
3. Write Register Dh with 4002h // Select register data for MMD – Device Address 2h, Register 10h.
4. Write Register Eh with 0001h // Write value 0001h to MMD – Device Address 2h, Register 10h.

- **MMD Register Read**

Read MMD – Device Address 2h, Register 11h – 13h for the magic packet's MAC address

1. Write Register Dh with 0002h // Set up register address for MMD – Device Address 2h.
2. Write Register Eh with 0011h // Select Register 11h of MMD – Device Address 2h.
3. Write Register Dh with 8002h // Select register data for MMD – Device Address 2h, Register 11h.
4. Read Register Eh // Read data in MMD – Device Address 2h, Register 11h.
5. Read Register Eh // Read data in MMD – Device Address 2h, Register 12h.
6. Read Register Eh // Read data in MMD – Device Address 2h, Register 13h.

## MMD Registers – Descriptions

Address	Name	Description	Mode <sup>(1)</sup>	Default

**Notes:**

- Exceeding the absolute maximum rating can damage the device. Stresses greater than the absolute maximum rating can cause permanent damage to the device. Operation of the device at these or any other conditions above those specified in the operating sections of this specification is not implied. Maximum conditions for extended periods may affect reliability.
- The device is not guaranteed to function outside its operating rating.
- $T_A = 25^\circ\text{C}$ . Specification is for packaged product only.

## Timing Diagrams

### RGMII Timing

The KSZ9031RNX RGMII timing conforms to the timing requirements in the RGMII Version 2.0 Specification.

**Figure 12. RGMII v2.0 Specification (Figure 3 – Multiplexing and Timing Diagram)**

Timing Parameter	Description	Min.	Typ.	Max.	Unit
TskewT	Data to clock output skew (at transmitter) per RGMII v1.3 (external delay)	-500		500	ps
TskewR	Data to clock input skew (at receiver) per RGMII v1.3 (external delay)	1.0		2.6	ns
TsetupT	Data to clock output setup (at transmitter – integrated delay)	1.2	2.0		ns
TholdT	Clock to data output hold (at transmitter – integrated delay)	1.2	2.0		ns
TsetupR	Data to clock input setup (at receiver – integrated delay)	1.0	2.0		ns
TholdR	Clock to data input hold (at receiver – integrated delay)	1.0	2.0		ns
Tcyc (1000Base-T)	Clock cycle duration for 1000Base-T	7.2	8	8.8	ns
Tcyc (100Base-TX)	Clock cycle duration for 100Base-TX	36	40	44	ns
Tcyc (10Base-T)	Clock cycle duration for 10Base-T	360	400	440	ns

**Table 19. RGMII v2.0 Specification (Timing Specifics from Table 2)**

The RGMII Version 2.0 Specification defines the RGMII data-to-clock skews only for 1000Mbps operation, which uses both clock edges for sampling the data and control signals at the 125MHz clock frequency (8ns period). For 10/100Mbps operations, the data signals are sampled on the rising clock edge and the control signals are sampled on both clock edges. With slower clock frequencies, 2.5MHz (400ns period) for 10Mbps and 25MHz (40ns period) for 100Mbps, the RGMII data-to-clock skews for 10/100Mbps operations will have greater timing margins than for 1000Mbps operation, and therefore can be relaxed from 2.6ns (max) for 1000Mbps to 160ns (max) for 10Mbps and 16ns (max) for 100Mbps.

## Auto-Negotiation Timing

### AUTO-NEGOTIATION FAST LINK PULSE (FLP) TIMING

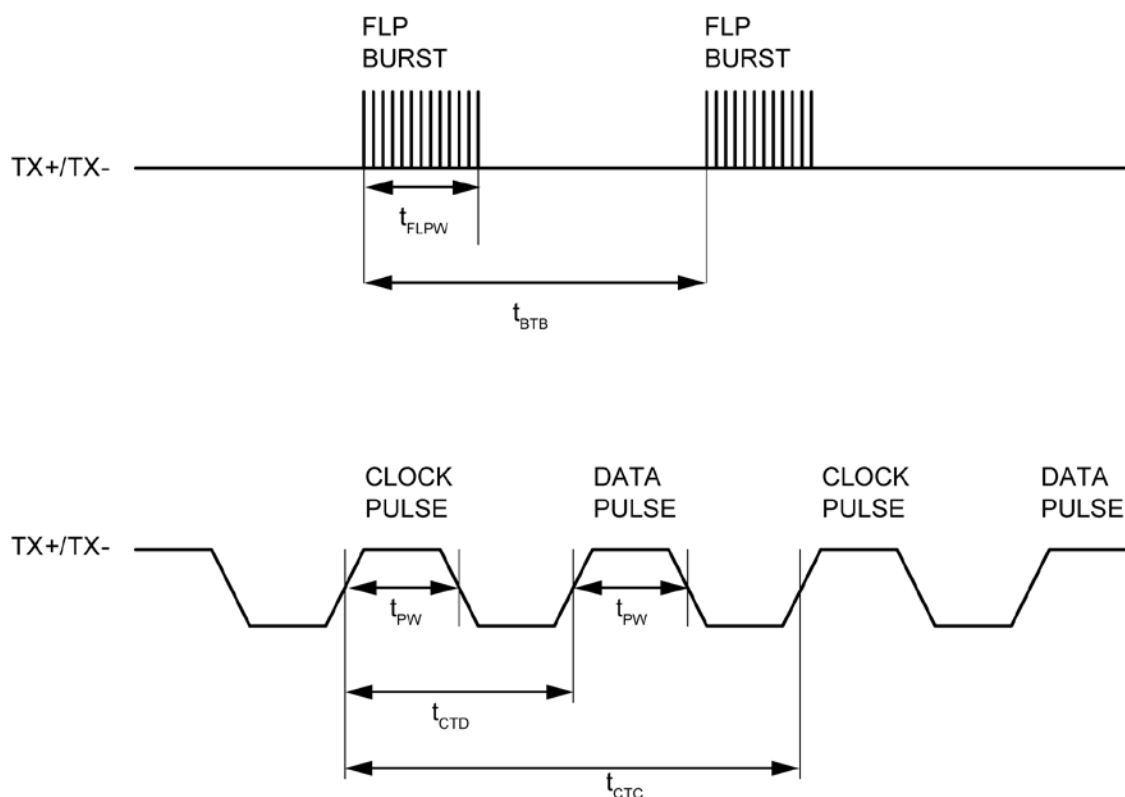

Figure 13. Auto-Negotiation Fast Link Pulse (FLP) Timing

Timing Parameter	Description	Min.	Typ.	Max.	Units
$t_{BTB}$	FLP burst to FLP burst	8	16	24	ms
$t_{FLPW}$	FLP burst width		2		ms
$t_{PW}$	Clock/Data pulse width		100		ns
$t_{CTD}$	Clock pulse to data pulse	55.5	64	69.5	$\mu$ s
$t_{CTC}$	Clock pulse to clock pulse	111	128	139	$\mu$ s
	Number of clock/data pulses per FLP burst	17		33	

Table 20. Auto-Negotiation Fast Link Pulse (FLP) Timing Parameters

## MDC/MDIO Timing

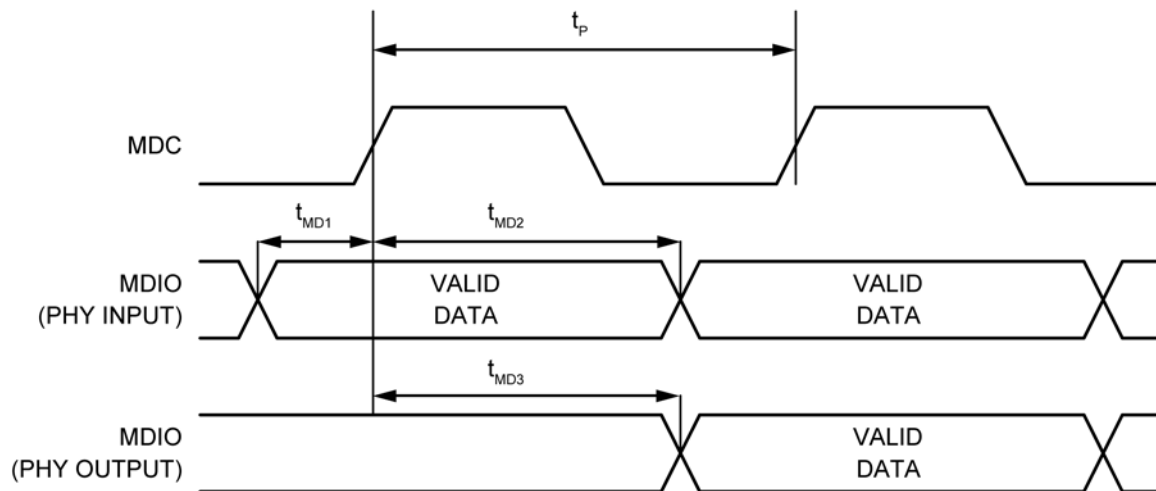

Figure 14. MDC/MDIO Timing

Timing Parameter	Description	Min.	Typ.	Max.	Unit
$t_P$	MDC period		400		ns
$t_{1MD1}$	MDIO (PHY input) setup to rising edge of MDC	10			ns
$t_{MD2}$	MDIO (PHY input) hold from rising edge of MDC	10			ns
$t_{MD3}$	MDIO (PHY output) delay from rising edge of MDC	0			ns

Table 21. MDC/MDIO Timing Parameters

## Power-Up/Power-Down/Reset Timing

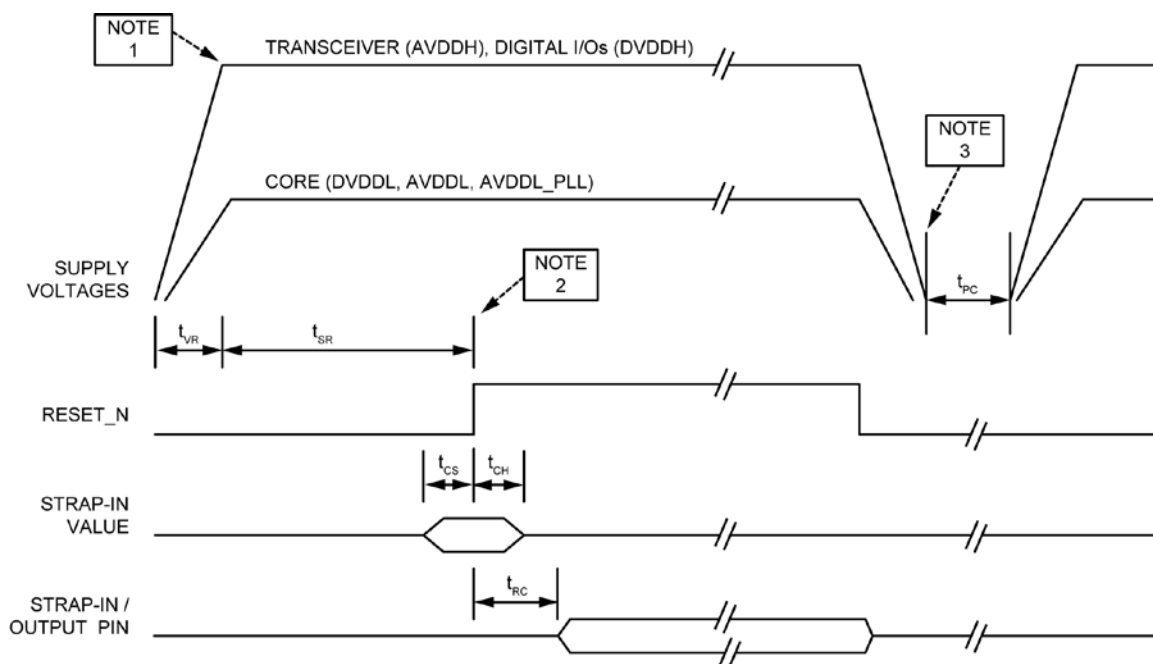

Figure 15. Power-Up/Power-Down/Reset Timing

Parameter	Description	Min	Max	Units
$t_{VR}$	Supply voltages rise time (must be monotonic)	200		$\mu\text{s}$
$t_{SR}$	Stable supply voltages to de-assertion of reset	10		ms
$t_{CS}$	Strap-in pin configuration setup time	5		ns
$t_{CH}$	Strap-in pin configuration hold time	5		ns
$t_{RC}$	De-assertion of reset to strap-in pin output	6		ns
$t_{PC}$	Supply voltages cycle off-to-on time	150		ms

Table 22. Power-Up/Power-Down/Reset Timing Parameters

**NOTE 1:** The recommended power-up sequence is to have the transceiver (AVDDH) and digital I/O (DVDDH) voltages power up before the 1.2V core (DVDDL, AVDDL, AVDDL\_PLL) voltage. If the 1.2V core must power up first, the maximum lead time for the 1.2V core voltage with respect to the transceiver and digital I/O voltages should be 200 $\mu\text{s}$ .

There is no power sequence requirement between transceiver (AVDDH) and digital I/O (DVDDH) power rails.

The power-up waveforms should be monotonic for all supply voltages to the KSZ9031RNX.

**NOTE 2:** After the de-assertion of reset, wait a minimum of 100 $\mu\text{s}$  before starting programming on the MIIM (MDC/MDIO) interface.

**NOTE 3:** The recommended power-down sequence is to have the 1.2V core voltage power down before powering down the transceiver and digital I/O voltages.

Before the next power-up cycle, all supply voltages to the KSZ9031RNX should reach 0V and there should be a minimum wait time of 150ms from power-off to power-on.

## Reset Circuit

The following reset circuit is recommended for powering up the KSZ9031RNX if reset is triggered by the power supply.

Figure 16. Recommended Reset Circuit

The following reset circuit is recommended for applications where reset is driven by another device (for example, the CPU or an FPGA). At power-on-reset, R, C, and D1 provide the necessary ramp rise time to reset the KSZ9031RNX device. The RST\_OUT\_N from the CPU/FPGA provides the warm reset after power-up.

Figure 17. Recommended Reset Circuit for Interfacing with CPU/FPGA Reset Output

## Reference Circuits – LED Strap-In Pins

The pull-up and pull-down reference circuits for the LED2/PHYAD1 and LED1/PHYAD0 strapping pins are shown in [Figure 18](#) for 3.3V and 2.5V DVDDH.

**Figure 18. Reference Circuits for LED Strapping Pins**

For 1.8V DVDDH, LED indication support is not recommended due to the low voltage. Without the LED indicator, the PHYAD1 and PHYAD0 strapping pins are functional with 10kΩ pull-up to 1.8V DVDDH for a value of 1, and with 1.0kΩ pull-down to ground for a value of 0.

Reference Clock – Connection and Selection

A crystal or external clock source, such as an oscillator, is used to provide the reference clock for the KSZ9031RNX. The reference clock is 25MHz for all operating modes of the KSZ9031RNX.

Figure 19 and Table 23 shows the reference clock connection to XI and XO of the KSZ9031RNX, and the reference clock selection criteria.

Figure 19. 25MHz Crystal/Oscillator Reference Clock Connection

Characteristics	Value	Units
Frequency	25	MHz
Frequency tolerance (max.)	±50	ppm
Crystal series resistance (typ.)	40	Ω
Crystal load capacitance (typ.)	22	pF

Table 23. Reference Crystal/Clock Selection Criteria

## Magnetic – Connection and Selection

A 1:1 isolation transformer is required at the line interface. Use one with integrated common-mode chokes for designs exceeding FCC requirements. An optional auto-transformer stage following the chokes provides additional common-mode noise and signal attenuation.

The KSZ9031RNX design incorporates voltage-mode transmit drivers and on-chip terminations.

With the voltage-mode implementation, the transmit drivers supply the common-mode voltages to the four differential pairs. Therefore, the four transformer center tap pins on the KSZ9031RNX side should not be connected to any power supply source on the board; rather, the center tap pins should be separated from one another and connected through separate 0.1 $\mu$ F common-mode capacitors to ground. Separation is required because the common-mode voltage could be different between the four differential pairs, depending on the connected speed mode.

Figure 20 shows the typical gigabit magnetic interface circuit for the KSZ9031RNX.

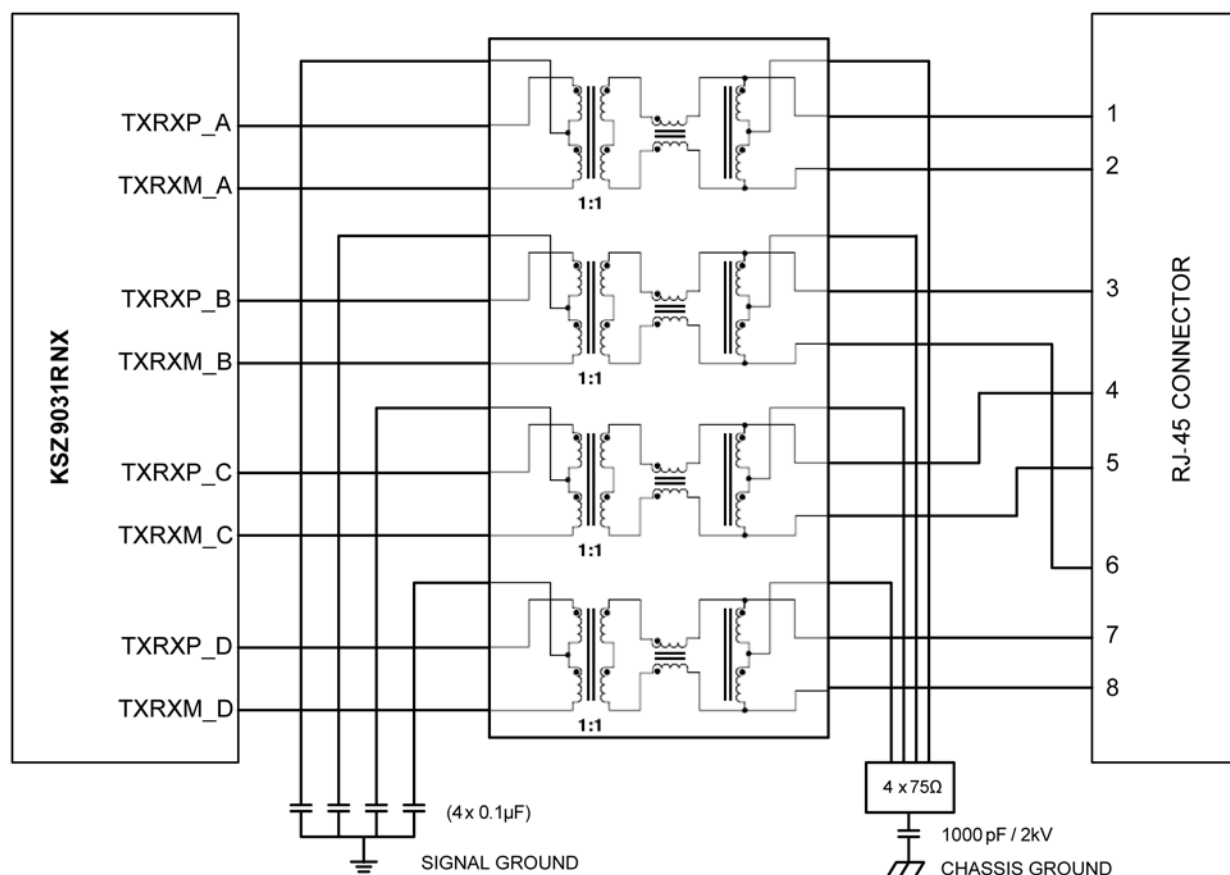

Figure 20. Typical Gigabit Magnetic Interface Circuit

Table 24 lists recommended magnetic characteristics.

Parameter	Value	Test Condition
Turns ratio	1 CT : 1 CT	
Open-circuit inductance (min.)	350 $\mu$ H	100mV, 100kHz, 8mA
Insertion loss (max.)	1.0dB	0MHz to 100MHz
HIPOT (min.)	1500Vrms	

**Table 24. Magnetics Selection Criteria**

Table 25 is a list of compatible single-port magnetics with separated transformer center tap pins on the G-PHY chip side that can be used with the KSZ9031RNX.

Manufacturer	Part Number	Auto-Transformer	Temperature Range	Magnetic + RJ-45
Bel Fuse	0826-1G1T-23-F	Yes	0°C to 70°C	Yes
HALO	TG1G-E001NZRL	No	–40°C to 85°C	No

## Package Information<sup>(1)</sup>

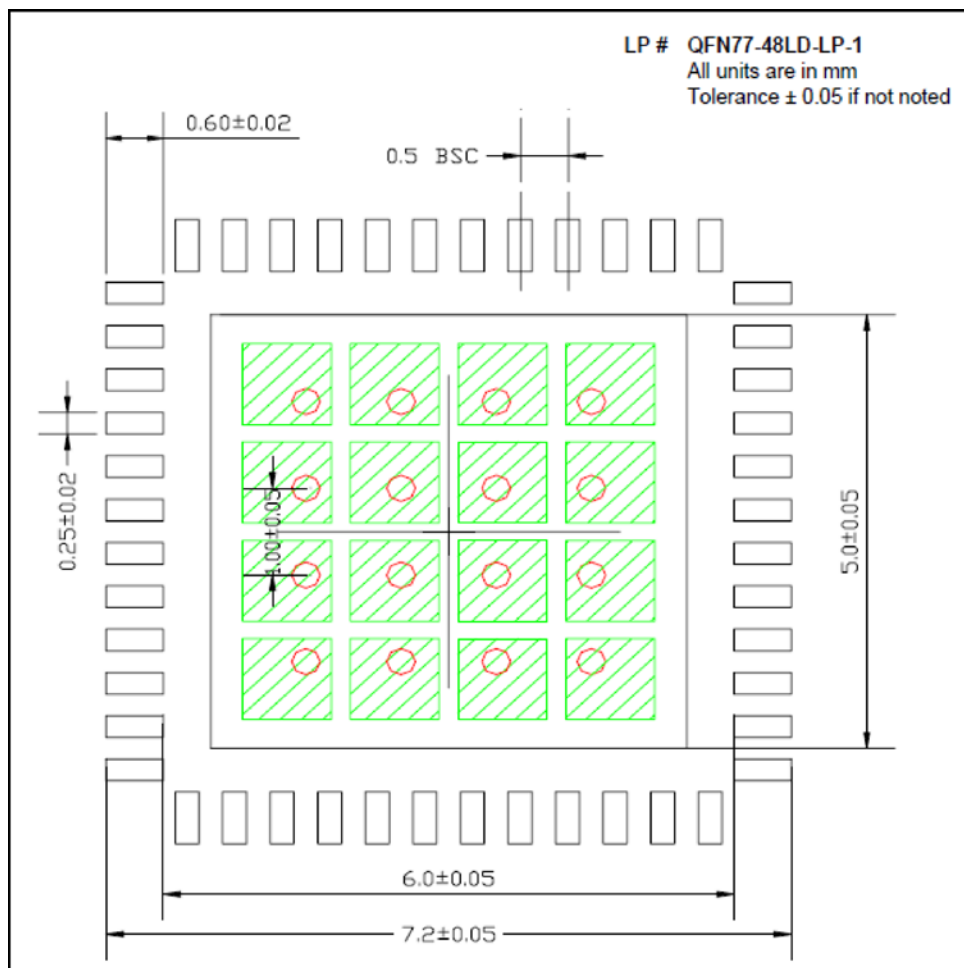

**48-Pin (7mm × 7mm) QFN**

### Note:

- Package information is correct as of the publication date. For updates and most current information, go to [www.micrel.com](http://www.micrel.com).

## Recommended Landing Pattern

Red circles indicate thermal vias. They should be 0.350mm in diameter and be connected to the GND plane for maximum thermal performance.

Green rectangles (with shaded area) indicate solder stencil openings on the exposed pad area. They should be 0.93x0.93mm in size, 1.13mm pitch.
